Owner/Op end date: Not reported

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005

BAUMERT SALES CO INC (Continued) **1000298488**

Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Violation Status: No violations found

Evaluation Action Summary:
Evaluation date: 01/17/1998
Evaluation: FOCUSED COMPLIANCE INSPECTION
Area of violation: Not reported
Date achieved compliance: Not reported
Evaluation lead agency: State

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D019
Waste name: CARBON TETRACHLORIDE

Waste code: D000
Waste name: Not Defined

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Property Highlights: Once clean, this property will be used by Goodwin College, a non-profit institution, to create a Connecticut River Campus, including public and private open space and river access. PPF - Former General Oil Property, 12/20/06 7/31/09: Remediation AAction Plan draft finished with final version to be completed in August 2009. 9/30/09: Remediation Action Plans for both 133 and 195

FORMER GENERAL OIL - 133 (Continued) **1014475841**

Riverside Drive were completed and are under public review. On 9/30/09, a public meeting was held at Goodwin Colleege to discuss the plans and solicit public comment on them. Additionally, in September 2009 a Request for Proposals was prepared and issued to potential remediation contractors for remedial work at 133 and 195 Riverside Drive.

Property Description: 133 and 195 Riverside: Goodwin College Inc deed:2933/222 acquisition date: 08/15/2007 Site is a former petroleum storage and distribution facility. Immediate past owner is Whitestar Holding Company. The 133 Riverside Drive parcel is 1.98 acres inn size and contained a one-story concrete building with a footprint of approximately 3,300 square feet. This building was constructed in 1952 and was occupied by HHS Mechanical Contractors, a piping system design and fabrication contractor. The buildding's garage was reportedly used previously for vehicle washing and possibly for vehicle repair or maintenance. The property was used as a petroleum terminal by 1952. The final three above-ground bulk petroleum storage tanks were removed from this pparcel in 2005. The 4.15-acre 195 Riverside Drive parcel abuts 133 Riverside Drive to the south and contained two one-story, brick industrial buildings with footprints of approximately 1,500 and 7,300 square feet. The smaller building was occupied bby JC Mechanical Controls, a heating and air conditioning contractor. The larger building was vacant at the time of the Phase II ESA and was most recently occupied by Alert, Inc., a scientific instrumentation service company. The southern portion ofthe larger building was likely used for vehicle repair and maintenance and contained a shop for Alert. A petroleum terminal with up to eight above-ground storage tanks ASTs operated on this parcel beginning in the 1930s or 1940s. The tanks were removved from the property during the period of 1989 through 1996.

Property Highlights:	Excavation and off-site disposal of petroleum contaminated soil occurred from Nov. 2009 to Jan. 2010. A temporary, magnet high school is currently being constructed on the site and will open in August 2010.
Property Description:	Site was formerly part of General Oil Terminal until 1990's. The site had been used to store and handle petroleum products such as fuel oil, kerosene, and diesel fuel from the 1930's to early 1990's. The site had been unoccuppied from the 1990's unttil 2005.

Land type: Private
Classification: TSDF
Description: Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification: Large Quantity Generator
Description: Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Hazardous Waste Summary:
Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED

ANDREW WILLGOOS TURBINE LABORATORY (Continued) **1000892582**

IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Amount (Lbs): 435

Corrective Action Summary:
Event date: 09/23/1992
Event: RFA Completed, Assessment was a PA-Plus.

Event date: 11/24/1992
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.

Event date: 04/12/1996

ANDREW WILLGOOS TURBINE LABORATORY (Continued) **1000892582**

Event: CA772GC

Event date: 07/17/1996
Event: RFI Imposition

Event date: 11/22/1996
Event: RFI Workplan Received

Event date: 08/01/2001
Event: CA770GW

Event date: 12/13/2001
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 01/06/2003
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Facility Has Received Notices of Violations:
Regulation violated: SR - 22a-449(c)-105(a)(1)
Area of violation: Generators - Pre-transport
Date violation determined: 02/03/1998
Date achieved compliance: 12/08/1999
Violation lead agency: EPA
Enforcement action: INITIAL 3008(A) COMPLIANCE
Enforcement action date: 09/30/1999
Enf. disposition status: Not reported
Enf. disp. status date: Not reported
Enforcement lead agency: EPA
Proposed penalty amount: 600
Final penalty amount: Not reported
Paid penalty amount: Not reported

Environmental Interest/Information System

CAMDBS (Clean Air Markets Division Business System) is a national information system that supports the implementation of market-based air pollution control programs administered by the Clean Air Markets Division, within the Office of Air and Radiation. These programs include the Acid Rain Program, established by Title IV of the Clean Air Act Amendments of 1990, and regional programs designed reduce the transport of ozone. These emissions trading programs allows regulated facilities (primarily electric utilities) to adopt the most cost-effective strategies to reduce emissions at their units. Units that reduce their emissions below the number of allowances they hold -- each allowance is equivalent to one ton of sulfur dioxide or nitrogen oxides -- may trade allowances with other units in their system, sell them to other utilities on the open market or through EPA auctions, or bank them to cover emissions in future years. CAMDBS functions include registering responsible officials, establishing allowance accounts, reporting hourly emissions data, and transferring allowances between accounts.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that

ANDREW WILLGOOS TURBINE LABORATORY (Continued) **1000892582**

these facilities release directly to air, water, land, or that are transported off-site.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

US EPA RACT/BACT/LAER Clearinghouse (RBLC) database contains case-specific information on the "Best Available" air pollution technologies that have been required to reduce the emission of air pollutants from stationary sources (e.g., power plants, steel mills, chemical plants, etc.). RACT, or Reasonably Available Control Technology, is required on existing sources in areas that are not meeting national ambient air quality standards. BACT, or Best Available Control Technology, is required on major new or modified sources in clean areas. LAER, or Lowest Achievable Emission Rate, is required on major new or modified sources in non-attainment areas.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Property Highlights: Once clean, this property will be used by Goodwin College, a non-profit institution, to create a Connecticut River Campus, including public and private open space and river access. PPF - Former Motiva Petroleum Terminal, 12/20/06

Property Description: Former petroleum storage and distribution facility. Past owner Motiva Enterprises, LLC. Immediate past owner: 211 Riverside, LLC. Current owner: Goodwin College Inc deed: 2933/225 date of sale: 08/15/2007. Two one-story, brick buildings occupied tthe western portion of this parcel west of Riverside Drive. The buildings were constructed in 1931. The westernmost building was a former warehouse with a footprint of approximately 7,900 square feet. The second structure was a former office/garage bbuilding of approximately 7,500 square feet. The southern portion of the smaller building was used to service vehicles. The eastern portion of this parcel is located east of Riverside Drive and contains no buildings. Above ground bulk petroleum storaage tanks occupied the western portion of the property beginning circa 1931 and the eastern portion of the parcel by 1952. The tanks were removed in 2002.

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D006
Waste name: CADMIUM

Waste code: D007
Waste name: CHROMIUM

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F009

PRATT & WHITNEY, COLT STREET (Continued) **1000881036**

Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Waste code: D035
Waste name: METHYL ETHYL KETONE

Waste code: D039
Waste name: TETRACHLOROETHYLENE

Waste code: D040
Waste name: TRICHLOROETHYLENE

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: D000
Waste name: Not Defined

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A

PRATT & WHITNEY, COLT STREET (Continued) **1000881036**

CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D006
Waste name: CADMIUM

Waste code: D007
Waste name: CHROMIUM

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Amount (Lbs): 272566

Corrective Action Summary:
Event date: 12/31/1986
Event: RFA Completed, Assessment was a PA-Plus.

Event date: 09/03/1993
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 04/14/1995
Event: Stabilization Measures Evaluation,This facility is not amenable to stabilization activity because of a lack of technical data. An evaluation has been completed, but further data is necessary to determine stabilization measures, feasibility or appropriateness. This status should be changed when data becomes available.

Event date: 04/12/1996
Event: CA772GC

Event date: 07/17/1996
Event: RFI Imposition

Event date: 10/30/1996
Event: CA770NG

Event date: 11/22/1996
Event: RFI Workplan Received

Event date: 11/10/1999
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 11/10/1999
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater

PRATT & WHITNEY, COLT STREET (Continued) **1000881036**

remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include;

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants.

FOUNDRY INC (Continued) **1000494806**

AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

EPA Region: 01
Land type: Facility is not located on Indian land. Additional information is not known.
Classification: Non-Generator
Description: Handler: Non-Generators do not presently generate hazardous waste

Owner/Operator Summary:
Owner/operator name: VINCI OIL CO
Owner/operator address: OWNERSTREET
OWNERCITY, CT 99999
Owner/operator country: Not reported
Owner/operator telephone: (203) 555-1212
Legal status: Private
Owner/Operator Type: Owner
Owner/Op start date: Not reported
Owner/Op end date: Not reported

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No

M & S CHROME PLATING INC (Continued) **1000130448**

On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

M & S CHROME PLATING INC (Continued) **1000130448**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

EPA Region:	01
Land type:	Private
Classification:	TSDF
Description:	Handler is engaged in the treatment, storage or disposal of hazardous waste
Classification:	Large Quantity Generator
Description:	Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: Yes
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Universal Waste Summary:
Waste type: Batteries
Accumulated waste on-site: Yes
Generated waste on-site: No

Waste type: Lamps
Accumulated waste on-site: Yes
Generated waste on-site: No

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D007
Waste name: CHROMIUM

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL

PRATT & WHITNEY (Continued) **1000881153**

BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F004
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F009
Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F011
Waste name: SPENT CYANIDE SOLUTIONS FROM SALT BATH POT CLEANING FROM METAL HEAT TREATING OPERATIONS.

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Corrective Action Summary:

Event date: 09/03/1993
Event: CA Prioritization, Facility or area was assigned a medium corrective action priority.

Event date: 04/14/1995
Event: RFA Completed, Assessment was an RFA.

Event date: 04/14/1995
Event: Stabilization Measures Evaluation

Event date: 07/17/1996
Event: RFI Imposition

Event date: 10/02/1997
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

Event date: 06/03/1998
Event: Stabilization Measures Implemented, Other Activity

Event date: 01/26/1999
Event: Stabilization Construction Completed

Event date: 01/26/1999
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

Event date: 03/04/1999
Event: Stabilization Construction Completed

Event date: 03/04/1999
Event: Stabilization Construction Completed

Event date: 02/22/2005
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Corrective Action Summary:
Event date: 03/27/1990
Event: RFI Imposition

Event date: 07/07/1992
Event: RFA Completed, Assessment was a PA-Plus.

Event date: 07/08/1992
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 04/12/1996
Event: CA772GC

Event date: 02/22/1999
Event: RFI Workplan Received

Event date: 10/22/2003
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Registry ID: 110006646246

Environmental Interest/Information System
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of

COLTSVILLE HERITAGE PARK INC (Continued) **1000840930**

Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/30/2012

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/30/2012

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/27/2011

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

SHWS: Inventory of Hazardous Disposal Sites

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/23/2010

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/27/2011

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

LWDS: Connecticut Leachate and Wastewater Discharge Sites

The Leachate and Waste Water Discharge Inventory Data Layer (LWDS) includes point locations digitized from Leachate and Wastewater Discharge Source maps compiled by the Connecticut DEP. These maps locate surface and groundwater discharges that (1) have received a waste water discharge permit from the state or (2) are historic and now defunct waste sites or (3) are locations of accidental spills, leaks, or discharges of a variety of liquid or solid wastes.

Date of Government Version: 07/17/2009

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

CPCS: Contaminated or Potentially Contaminated Sites

A list of Contaminated or Potentially Contaminated Sites within Connecticut. This list represents the "Hazardous Waste Facilities," as defined in Section 22a-134f of the Connecticut General Statutes (CGS). The list contains the following types of sites: Sites listed on the Inventory of Hazardous Waste Disposal Sites; Sites subject to the Property Transfer Act; Sites at which underground storage tanks are known to have leaked; Sites at which hazardous waste subject to the RCRA; Sites that are included in EPA's (CERCLIS); Sites that are the subject of an order issued by the Commissioner of DEP that requires investigation and remediation of a potential or known source of pollution; and Sites that have entered into one of the Department's Voluntary Remediation Programs.

Date of Government Version: 01/28/2011

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

NJ MANIFEST: Manifest Information

Hazardous waste manifest information.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Child Care Facilities
Source: Department of Public Health
Telephone: 860-509-8045

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Soils
Source: Department of Environmental Protection
Telephone: 860-871-4047

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Most Recent Revision:	1992
North Map:	41072-G6 HARTFORD NORTH, CT
Most Recent Revision:	1992

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

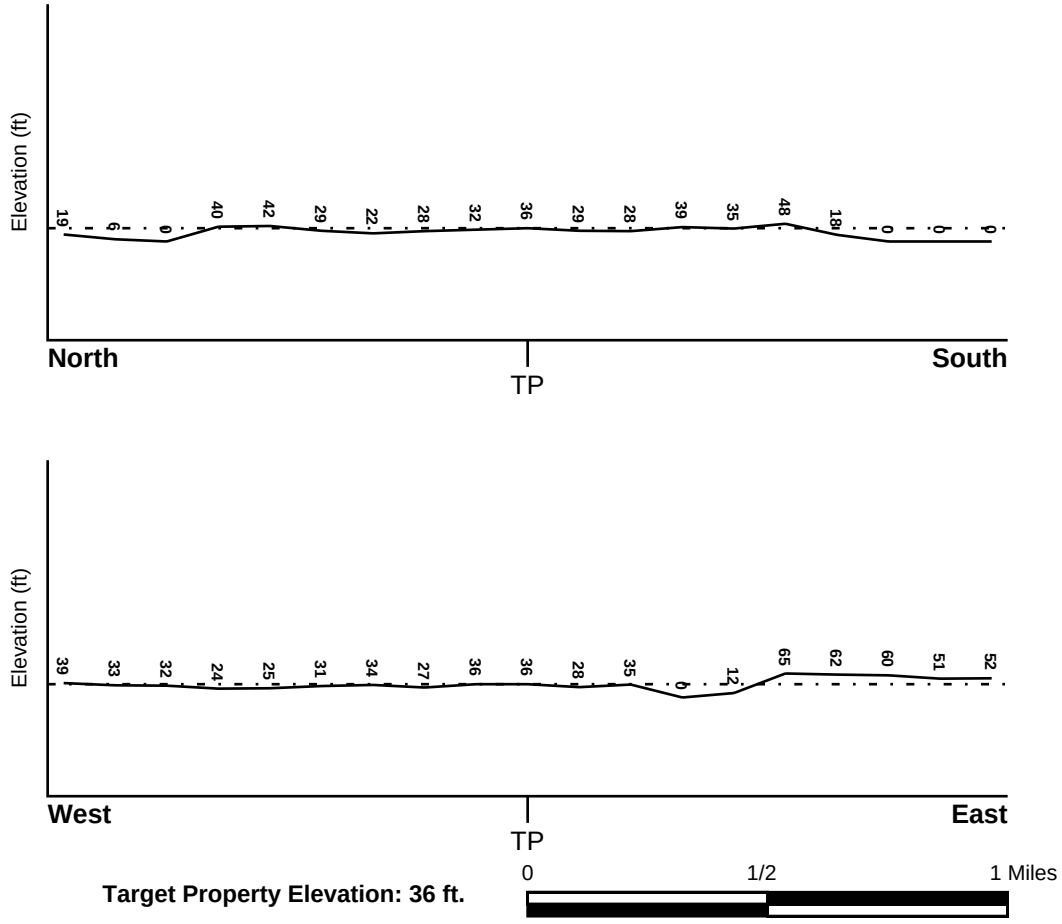
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General East

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
HARTFORD, CT	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 09003C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
HARTFORD SOUTH	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Udorthents

Soil Surface Texture: loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5
2	5 inches	21 inches	gravelly loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5
3	21 inches	79 inches	very gravelly sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5

Soil Map ID: 2

Soil Component Name: Water

Soil Surface Texture: loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: Winooski

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 69 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 4	Max: 7.3 Min: 5.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 4

Soil Component Name: Urban land

Soil Surface Texture: material

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	material	Not reported	Not reported	Max: 141 Min: 0.07	Max: Min:

Soil Map ID: 5

Soil Component Name: Udorthents

Soil Surface Texture: loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5
2	5 inches	21 inches	gravelly loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5
3	21 inches	79 inches	very gravelly sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 703 Min: 0.01	Max: 7.8 Min: 4.5

Soil Map ID: 6

Soil Component Name: Udorthents

Soil Surface Texture: loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Soils
Source: Department of Environmental Protection
Telephone: 860-871-4047

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Connecticut Leachate and Wastewater Discharge Sites
Source: Department of Environmental Protection
The Leachate and Waste Water Discharge Inventory Data Layer (LWDS) includes point locations digitized from Leachate and Wastewater Discharge Source maps compiled by the Connecticut DEP. These maps locate surface and groundwater discharges that (1) have received a waste water discharge permit from the state or (2) are historic and now defunct waste sites or (3) are locations of accidental spills, leaks, or discharges of a variety of liquid or solid wastes.

EPA-Approved Sole Source Aquifers in Connecticut
Source: EPA
Sole source aquifers are defined as an aquifer designated as the sole or principal source of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for the area and for which there are no reasonable alternative sources should the aquifer become contaminated.

Community and Non-Community Water System Wells
Source: Department of Public Health, Water Supplies Section
Telephone: 860-509-7333
Active, emergency and inactive wells used for potable purposes that are owned and operated by active community and non-community water systems in Connecticut.

OTHER STATE DATABASE INFORMATION

RADON

State Database: CT Radon
Source: Department of Public Health
Telephone: 860-509-7367
Radon Statistical Summary

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report AS IS. Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

MARYA B. MAHONEY, LEP

EDUCATION

M.S., Geology, University of Connecticut, 1997
B.A., Geology, Vassar College, 1994

PROFESSIONAL REGISTRATIONS

Licensed Environmental Professional, Connecticut, (#478), 2007

AREAS OF EXPERTISE

Ms. Marya B. Mahoney is a Project Geologist at TRC and has management and technical experience in the following general areas:

- Project Management
- Environmental Site Assessments (Phase I,II and III)
- Remediation Planning and Execution
- Brownfields and Property Redevelopment
- Environmental Sampling

REPRESENTATIVE EXPERIENCE

Ms. Mahoney is a Project Geologist in TRC's Hazardous Materials Division with 15 years of experience and progressive responsibility in environmental consulting. She has extensive experience in the oversight and management of investigation and remediation of hazardous waste sites. Projects have ranged from environmental site assessments, remedial investigations, feasibility studies, and pre-design investigations to remedial design and completion. She has also acted as field team leader for various field programs and has conducted Phase I environmental assessments for various Connecticut as well as national clients. Her duties include assessing environmental data for the purposes of reporting as well as designing field investigation programs; writing proposals, work plans and Quality Assurance Project Plans; completing background investigations and receptor surveys; writing Remedial Action Plans and reporting on site investigations and remedial activities. Ms. Mahoney's project work has included federal Superfund, RCRA Corrective Action, and numerous state programs.

Phase II and III Field Investigations/Remediation Activities

Connecticut Department of Transportation, Various Sites/Projects, CT (Task Manager: 2007-Present)

As Task Manager under the current on–call Soil and Ground Water Contract, Ms. Mahoney manages various assignments related to the completion of a wide range of environmental projects associated with ConnDOT construction and improvement projects. These services include performance of due diligence investigations for corridor projects, site acquisitions and facilities undergoing planned improvements; characterization of soil and ground water impacts; aid in

the development of technical plans and specifications to manage contaminated environmental media on construction projects; and providing regulatory compliance support for projects. Representative projects are as follows:

Avon Maintenance Facility: Avon, CT: Ms. Mahoney acted as the Project Manager for the Tasks 210 and 310 conducted at ConnDOT's Avon Maintenance Facility. She designed a soil and ground water sampling program that focused on the ConnDOT's project area and developed a work plan outlining the details of the investigation. Ms. Mahoney coordinated and managed the field work elements of the investigation and prepared a Task 210 investigation report for review and use by ConnDOT. She also managed the completion of the Task 310 assignment.

Disposal Facility Audit: Various Sites (2007-Present): Ms. Mahoney has provided regulatory program support under the current contract. She has served as task manager of the audit of ConnDOT-approved disposal vendors.

Route 7 By-Pass Construction Project: Brookfield, CT (2008-2009): Ms. Mahoney served as manager of the Task 610/620 assignments related to the oversight of the removal of impacted soils and solid waste from two areas of environmental concern within the Route 7 by-pass construction corridor. These areas of environmental concern were associated with historic disposal/land-filling in the vicinity of the Brookfield Maintenance Garage. Ms. Mahoney tracked daily project progress and compliance with the approved remedial action plan for the areas, prepared a confirmation sampling plan and prepared an alternative plan to the original solid waste disruption authorization. She served as a liaison between ConnDOT and Connecticut Department of Environmental Protection personnel to ensure completion of the project to the expectations of both departments.

Replacement of Bridge 05225 over Simpaug Turnpike: Redding, CT: Ms. Mahoney served as manager of the Task 210 assignment for this project. The tasks included in this project included preparation of a work plan, completion of a soil and ground water sampling program and preparation of a report in support of the activities associated with the replacement of the structural members of a bridge over the Metro-North railroad.

Routes 74 and 286 Roundabout: Ellington, CT: Ms. Mahoney served as task manager for the due diligence efforts (Task 110) to assess properties that will be acquired in support of the planned construction of a traffic roundabout.

Confidential Client, Phase II/III Investigations/Remediation and Connecticut Transfer Act Support – Retail Site, Glastonbury, CT (Project Manager: 2007-Present)
Prior to managing this project, Ms. Mahoney served as an assistant project manager for environmental activities conducted at this retail/former laundromat site. Ms. Mahoney has managed the development of work plans and sampling

programs at this chlorinated solvent and petroleum hydrocarbon-impacted site and is currently developing a remedial action plan to outline to appropriate actions necessary to mitigate the impacts to the soil and ground water at the site. Ms. Mahoney recently provided Connecticut Transfer Act support by preparing Property Transfer Program Forms in support of the transfer of the property.

Grace Development Corporation, Phase I/II/III Investigations and Remediation, Waterbury, CT (Project Manager 2006 – Present):
Ms. Mahoney has served as project manager for this Waterbury site which currently houses an eldercare facility and that is undergoing additional development to become an elderly housing complex. She managed the completion of two Phase I assessments at the property and based on the findings, developed a soil investigation program. Following completion of the soil investigation which indicated the presence petroleum, lead and PAH-impacted soils, Ms. Mahoney developed a soil remediation program which is currently underway.

City of Stamford, Phase II Investigations – Various Sites, Stamford, CT (Project Analyst / Assistant Project Manager: 2006-Present)
Ms. Mahoney assisted in the preparation of work plans for investigations conducted at several Stamford sites, including the West Beach fields, Lione Park and the Westhill High School. She also analyzed data associated with the Phase II investigations and performed review of the associated reports.

City of Stamford, Environmental Support – Various Sites, Stamford, CT (2006 – Present)
Ms. Mahoney has performed several sub-tasks related to the overall environmental support task. Specifically, she has coordinated field activities, acted as field manager, reviewed data derived from the analysis of environmental samples and has provided recommendations for subsequent actions based on the data.

SPX Corporation, O-Z Gedney Facility Field Investigation/Remediation Activities – Terryville, CT (Assistant Project Manager: 1999 – Present)
Ms. Mahoney assisted in preparation of Work Plan and prepared a site-specific health and safety plan. She managed and conducted Phase II field investigation activities including: monitoring well installation, soil boring sampling (hollow stem auger and GeoProbe), test pit excavation, stream gauge installation, ground water sampling (low-flow purge and sample technique) stream sediment sampling, and surface water sampling. She assessed data and prepared report for client and CTDEP review.

Ms. Mahoney followed up initial Phase II investigation by assisting in preparation of a supplemental investigation work plan. She managed and aided in conducting supplemental Phase II field investigation activities. Ms. Mahoney assessed supplemental data in conjunction with the initial Phase II investigation

data and prepared report for client and CTDEP review. She managed and conducted a Phase III investigation and prepared Phase III investigation report for client and CTDEP review. She assisted in the preparation of a remedial action plan for the site (CTDEP approved December 2002). Currently Ms. Mahoney is assisting in management of remediation program and preparation of remedial action report for CTDEP review.

SPX Corporation, Fenn Manufacturing Phase II/III and Remedial Investigations – Newington, CT (Assistant Project Manager: 2002 – Present)
Ms. Mahoney conducted review of historical environmental investigation information for the site. She assisted in identification of potential areas of concern and subsequent development of investigation work plan. She also managed and conducted field work to investigate potential areas of concern (chlorinated solvent, petroleum and PCB-impacted areas). Ms. Mahoney reviewed soil and ground water data and prepared investigation summary report for client review and submission to CTDEP. She also developed sampling plan for Phase III investigation and aided in preparation for remediation of the site.

Nine Carlton Street, Inc., Phase II/III and Remediation – Wallingford, CT (Assistant Project Manager: 2004 – Present)
Ms. Mahoney designed and managed Phase II and III investigations for former industrial/commercial site under the CTDEP Voluntary Clean-up Program. She completed data assessment and reporting, prepared remedial action plan, managed remediation activities. Remedial action reporting and post-remediation ground water monitoring are underway.

Federal Aviation Administration, FAA Technical Center Field Investigation/ Remediation Activities – Atlantic City, NJ (Field Team Leader: 1997 – Present)
Ms. Mahoney acted as field team leader for most recent phases of investigation/pre-remediation work of an area impacted by chlorinated solvents (TCE/PCE) and mercury. Activities included extensive soil boring/monitoring well installation, screened auger and temporary well installation/ sampling (to define TCE/PCE plume), a GeoProbe investigation and ground water sampling. She assisted in design of injection and extraction wells for remediation system. Ms. Mahoney participated in conducting a pump test and conducted infiltration testing. She also assisted in preparation of pump test/modeling report and Remedial Investigation/Feasibility Study (RI/FS) Work Plan. She prepared responses to EPA comments on RI/FS Work Plan and aided in executing field work elements of Work Plan. Ms. Mahoney served as a field team leader for RI field activities including telemetry setup in reservoir, sediment/soil sampling, surface water sampling, source area GeoProbe investigation, wellpoint and ground water monitoring well sampling. She is preparing RI report.

Ms. Mahoney participated in pre-remediation design activities at an area impacted by PCBs and petroleum-related constituents. She acted as field team

leader for field activities including: delineation of PCB-impacted area utilizing traditional field sampling methodologies and field sampling test kit for PCBs (D-Tech immunoassay kit); an extensive GeoProbe soil and ground water investigation, infiltration testing, and treatability studies.

Ms. Mahoney acted as field team leader for Supplemental RI investigations at three sites within FAA complex (former military installation sites). She conducted extensive ground water profiling effort at two of the sites to determine the horizontal and vertical extents of chlorinated solvent plume. She analyzed supplemental RI data and prepared a report documenting procedures and findings at all three sites for client review.

Ms. Mahoney conducted Preliminary Assessments/Site Inspection (PA/SI) at an area with potential explosive impacts. She prepared PA/SI report for client and EPA review. She also conducted an investigation to determine the source of pesticide contamination. Field activities included ground water and soil sampling utilizing a GeoProbe.

New York City Economic Development Corporation, Ballpark at St. George Station Field Investigation – Staten Island, NY (Field Operations Manager: 1998 –2001)
Ms. Mahoney acted as field operations manager for several phases of field investigations at the home of the Staten Island Yankees. Field activities included soil boring and monitoring well installation, extensive surface soil, soil, and shoreline sediment sampling, a geophysical survey, a UST removal, and ground water sampling (low-flow purge and sample technique). She assisted in data assessment and preparation of two investigation reports and prepared a third investigation report.

Nielsen Hardware, Investigation and Remediation – Hartford, CT (Assistant Project Manager: 2003 – Present)
Ms. Mahoney aided in designing Phase II and III investigations of areas of concern identified on two parcels. She managed field work for completion of investigations. She also assessed data in the context of the CT RSRs, completed reporting for the site and participated in meetings to discuss remediation options.

Allegheny-Teledyne, Field Investigation/Remediation Activities – Ansonia, CT (Assistant Project Manger: 1998 – 2002)
Ms. Mahoney conducted GeoProbe investigation to confirm and assess presence of chlorinated solvents and petroleum-related contaminants. She assisted in conducting and managing remediation activities and in preparation/review of the final remedial action closure report. She also assisted in preparation of verification report for submittal to the CTDEP.

Brownfields and Property Redevelopment

Bridgeport Economic Development Corporation (BEDCO), Seaview Avenue Development – Bridgeport, CT (Assistant Project Manager: 2001 – 2006)
Ms. Mahoney reviewed Phase I reports to determine which sites required investigation. She aided in development of proposals, cost estimates and work plans (for initial and supplemental investigations) for three industrial sites in project area. She managed field activities which included completion of soil borings by GeoProbe and hollow stem auger, monitoring well installation and ground water sampling. Ms. Mahoney reviewed analytical data and completed reports. She analyzed investigation results to develop remedial action plans for two industrial sites (subsequently approved by Connecticut Department of Environmental Protection). She also prepared QAPPs related to the remediation of two sites (subsequently approved by the EPA). Ms. Mahoney managed remediation field activities and prepared remedial action reports for both sites (both also subsequently approved by the CTDEP).

City of Stamford, Stamford Urban Transitway (SUT) Project, Brownfields Program Support, Phase I, II and III – Stamford, CT (Assistant Project Manager: 2001 – Present)
Ms. Mahoney aided in the preparation of the Phase I assessments and, based on the findings, developed cost estimates for completion of Phase II investigation work at fifteen sites along the project corridor (based on an EPA-approved Quality Assurance Project Plan (QAPP). She analyzed data in conjunction with field notes and site history to develop investigation reports for fifteen project sites. She developed an investigation work plan/QAPP addendum for five of the fifteen sites that required additional work. Ms. Mahoney also assessed data and completed Phase III investigation reports for all five sites. She aided in estimation of remediation costs and in preparing remedial action plans for the five sites requiring remediation.

City of Stamford, Stamford Urban Transitway (SUT) Project, Remediation – Various Sites, Stamford, CT (Assistant Project Manager: 2006 – Present)
Ms. Mahoney has assisted in the preparation of the remedial action plans prepared for the sites along the SUT corridor where remediation was determined to be necessary. She has attended a meeting designed to educate the public about the remediation efforts and to address the questions and concerns presented by members of the local community. She has also acted as a coordinator for TRC field staff overseeing the remediation and has been analyzing data associated with the verification samples. She is also working on the preparation of remedial action reports for sites undergoing remediation.

Town of Winchester, Brownfields Program – Winsted/Winchester, CT (Co-Project Manager: 1999 – 2010)
Ms. Mahoney conducted various tasks associated with eight of the twelve Winchester Brownfields sites assessed to date as outlined below. She assisted

in data assessment, reporting and preparation of remediation costs associated with the former Lambert Kay site. She also assisted in management of field work, data assessment and reporting for all phases of investigation and remediation in support of a large-scale development effort of the Lippincott site. Ms. Mahoney assisted in reporting effort associated with the 115 Spencer Street site. She prepared QAPPs associated with Phase II (and where applicable, Phase III) investigations for the following sites: former Union Pin, former Carnell Lumber, 1 Lake Street, 95-97 Main Street and 100 Whiting Street. She acted as field team leader and/or manager for investigation activities at each of the sites mentioned above. Ms. Mahoney conducted data analysis and reporting associated with each of the sites. She prepared clean-up cost estimates and attended meetings in support of redevelopment efforts at the 1 Lake Street, 95-97 Main Street and 100 Whiting Street sites.

City of New Britain, Brownfields Program, Field Investigations and Remediation – New Britain, CT (Field Team Leader and Assistant Project Manager: 1999 – Present)
Ms. Mahoney has conducted field work, acted as field manager, reviewed environmental investigation data and prepared reports related to several New Britain Brownfields sites. In addition to the tasks outlined above, she has prepared QAPPs for various stages of investigation and remediation work and a remedial action plan for the former Pete's Automotive site. She has also provided senior oversight for several investigation reports issued for this site.

City of Danbury, Brownfields Program, Field Investigation – Danbury, CT (Field Team Leader: 1998 – 2000)
Ms. Mahoney conducted an investigation to assess the presence of mercury and other contaminants in site soils, ground water, surface soils, and sediments. Field activities included monitoring well installation, soil sampling, test pit excavation, surveying, stream sediment sampling, surface water sampling, and surface soil sampling. She was responsible for quarterly ground water sampling program. Ms. Mahoney collected samples to aid in assessing practicality of phytoremediation of site. She assisted in data assessment and preparation of final report.

Various Clients, Various Brownfields Sites, Field Investigations – New Britain and Middletown, CT (Field Team Leader and Assistant Project Manager: 1999 – Present)
Ms. Mahoney reviewed environmental investigation data and prepared reports for Brownfields sites in New Britain and Middletown, Connecticut.

Environmental Sampling

Shieldalloy Metallurgical Corporation, Environmental Sampling – Newfield, NJ (Field Team Member/Leader: 1997 – 2005)
Ms. Mahoney participated in quarterly (and annual) ground water sampling at the

New Jersey facility.

Federal Aviation Administration, FAA Technical Center Environmental Sampling –Atlantic City, NJ (Field Team Leader: 1997 – 2005)
Ms. Mahoney participated in quarterly ground water sampling. She acted as field supervisor for ground water sampling activities. She analyzed laboratory data, prepared ground water contour maps, prepared histograms based on historical analytical data from the site, prepared data summary tables, and prepared quarterly ground water monitoring reports.

Phase I Environmental Assessments

Various Clients, Environmental Site Assessments – CT (Assessor: 1997 – Present)
Ms. Mahoney conducted or most recently, managed, numerous Phase I environmental assessments involving commercial, residential, and undeveloped properties.

Red Roof Inns, Environmental Site Assessments – MI (Assessor: 1997 – 1998)
Ms. Mahoney conducted several Phase I environmental assessments of properties operated by Red Roof Inns in Michigan.

SPECIALIZED TRAINING

- OSHA 40 Hour HAZWOPER, June 1997
- OSHA 8 Hour Refresher, (Annually)
- Supervisory OSHA Health and Safety Training, February 2003
- Niton Spectrum Analyzer Certification, November

PROFESSIONAL AFFILIATIONS

- American Institute of Professional Geologists
- Environmental Professionals of Connecticut

SELECTED PUBLICATIONS AND PRESENTATIONS

Ms. Mahoney prepared cross sections, profiles, contour maps, and an extensive write-up for submission into a Connecticut Department of Environmental Protection (DEP) funded guidance document. Coauthored this document entitled: “Recommended Guidelines for Multilevel Soil and Ground Water in Conducting Expedited Site Investigations at Underground Storage Tank Sites in Connecticut,” March 12, 1997.

HARTFORD BRAINARD AIRPORT MASTER PLAN STUDY

1.0 AIRPORT INVENTORY

1.1 INTRODUCTION

1.1.1 Airport Location

The City of Hartford, the state capital, is centrally located in the State of Connecticut on the Western bank of the Connecticut River. In addition to being the governmental seat, Hartford is the commercial hub of Connecticut with the major north/south (I-91) and east/west (I-84) interstate highways intersecting within the city limits. See Location Map, Figure 1-1.

Hartford Brainard Airport, identified by the three letter designator HFD, is located in the southeasternmost sector of the City of Hartford approximately two miles southeast of downtown Hartford. Municipalities bordering Hartford include the Connecticut River and East Hartford to the east, Glastonbury to the southeast, Wethersfield to the south and Bloomfield and Windsor to the north. The airport borders are the Connecticut River to the east, the town of Wethersfield to the south, and a north/south transportation corridor which includes Interstate 91, the Wilbur Cross Highway and Railroad Avenue. See Vicinity Map, Figure 1-2.

1.1.2 Airport Historical Profile

The initial location for the Hartford Airport, then known as Brainard Field, named after a previous city mayor, was further north of the existing airport's location near Hartford Electric's South Meadows power station. The airfield has historical significance as the first New England Municipal 'flying field' which also became the first landing spot after Charles Lindburgh's historic transatlantic flight.

Brainard Field was dedicated on June 10, 1921 after Mayor Brainard had established a blue ribbon commission to establish airport facilities to service Hartford. The airport held

numerous air meets and the Connecticut National Guard Air Squadron was organized there in 1923.

Because the airfield is located in the Connecticut River Flood Plain, it was prone to serious flooding. After a flood in 1936, the Corps of Engineers (COE) built the Clark Dike to contain the banks from flooding. The COE now has an agreement with the City of Hartford to maintain the dike.

Until the late 1950's, the airport consisted of 351 acres occupying the area from the Clark Dike west to Brainard Road. At that time the airport included four runways, the existing Runway 2-20, Runway 9-27 (100' X 3600') connected to Runway 20 end, Runway 15-33 (100' X 3900') connected to Runway 9 end and Runway 5-23 (150' X 4800') connected to Runway 20 end. All runways except 2-20 were abandoned. At the time, the terminal area was situated between Runway 9-27 and Maxim Road. In the early 1960's, the State of Connecticut purchased the Brainard Airport from the City of Hartford. When the State of Connecticut took over the Hartford Brainard Airport, the City of Hartford retained ownership of the 150 acres between the Brainard Road and what is now the airport access road. Runway 9-27, 15-33 and 5-23 were abandoned at that time. Existing Runway 11-29 (70' X 2315') was constructed in 1966.

1.1.3 Airport Economic Value

Since industrial development land is at a premium in urban locations, there has been ongoing debate as to the economic value of maintaining Hartford Brainard's 200+ acres as an airport. Increased employment and tax base are the advantages for conversion of Brainard to industrial land use.

The Hartford City Planning Department conducted a study in 1982 entitled Brainard Airport: A Preliminary Investigation of Its Best Economic Value to the City of Hartford. Some of the factors documented were:

- Brainard is one of the busiest airports in the state in terms of operations.
- 148 full-time and part-time airport related employees contribute to the local economy.
- Long-term 20 year leases are about to expire so that new leases can be negotiated to put the airport in the black.
- Once the land is converted to another use, Brainard Airport cannot be replaced.

conversations with airport management and airport users. The discussion of airport facilities is divided into Airfield Facilities and Terminal Area Facilities and Services. The term airfield pertains to the runway and taxiway areas. The terminal area includes, aprons, hangars, parking lots, maintenance areas etc. A location of airfield and terminal facilities is depicted on Figure 1-3.

1.2.2 Airfield Facilities

1.2.2.1 Runways

The Hartford Brainard Airport has two runways. Runway 2-20 is 150 feet wide and 4,418 feet long and constructed of bituminous concrete. Runway 2 threshold is displaced 418 feet and Runway 20 threshold is displaced 549 feet. Available landing length is 3,990 feet on Runway 2 and 3,859 feet on Runway 20. Runway 11-29 is 70 feet wide and 2,315 feet long and also constructed of bituminous concrete. Runway 11 threshold is displaced 250 feet. Available landing length is 2,315 feet on Runway 11 and 2,048 feet on Runway 29. There is also a 250 foot wide and 2,309 foot long turf runway approximately parallel to Runway 2-20. Both paved runways have basic markings.

1.2.2.3 Taxiways

Runway 11-29 is served by a 30 foot wide partial parallel taxiway 150 feet to the north. Runway 2-20 is served by a 40 foot wide full length parallel taxiway 300 feet west and a 40 foot wide partial parallel taxiway 150 feet west of the full length taxiway. All other taxiways and stub taxiways are 30 feet wide.

1.2.2.4 Helicopter Landing Area

South of Taxiway D is an approximately 50' x 50' helicopter landing pad marked by an "H" surrounded by a segmented triangle pointing toward magnetic north. A paved taxiway connects the helicopter landing pad with the open to the west. A second helicopter landing pad is proposed east of the Air One, Inc. hangar.

The UNICOM is used as a traffic advisory tool among pilots and is especially useful when the air traffic control tower is not in operation.

An Automatic Terminal Information Service (ATIS) provides pilots at Brainard with up to date weather conditions, traffic control procedures and potential hazard information through use of the aircraft radio. The ATIS information is prerecorded by Brainard Tower personnel.

As mentioned previously, an FAA Air Traffic Control Tower named Brainard Tower is located at Hartford Brainard Airport and is operational 24 hours a day, seven days a week. Brainard Tower is equipped and staffed to provide VFR separation of arriving and departing aircraft and separation of aircraft on the ground at aircraft movement areas, i.e. runways and taxiways. The Brainard Tower coordinates arrivals and departures with both Rentschler Tower located at Rentschler Field in East Hartford and Bradley Approach Control located at Bradley International Airport in Windsor Locks, Connecticut. The responsibilities of the various air traffic control facilities is discussed in Section 1.3.5 Airspace.

1.2.3 Terminal Area Facilities

1.2.3.1 Buildings

Table 1-2 shows a detailed inventory of buildings located at the airport. All buildings are located west of Runway 2-20. In a south to north direction, airport buildings include the localizer building south of Runway 11-29, the FAA Control Tower at the end of Taxiway W, the Civil Air Patrol mobile home, three T-hangars, two portable hangars, the Cross Country Aviation hangar and terminal, one portable hangar, Corporate Air maintenance hangar Air One, Inc., terminal, Air One, Inc. hangar and shop building, Corporate Air and Airport Management offices, State Hangar, fire apparatus building, Connecticut Department of Transportation Bureau of Aeronautics Offices, Connecticut National Guard Offices and storage building and a building to house the CFR radio.

1.2.3.2 Aprons

Aircraft parking aprons and dimensions are listed on Table 1-3. Paved aircraft parking aprons are located between the T-hangars and Cross Country Aviation buildings, east of Cross Country

TABLE 1-2
HARTFORD BRAINARD AIRPORT
BUILDING INVENTORY AS OF JUNE 12, 1985

Building	Dimensions	Use	Condition
FAA Control Tower	17' x 18'	Control Tower	Good
Civil Air Patrol	N/A	Offices and Classroom	Good
3 T-hangars	30 x 300'	Individual Hangar Spaces	Poor
3 Portable Hangars	N/A	Individual Hangar Bldgs.	Good
Cross Country Aviation Hangar	100' x 100'	Aircraft Maint. and Storage	Fair
Cross Country Aviation Terminal	96'4" x 110'	Pilots Lounge, Terminal Coffee Shop, Parts Area and Offices	Fair
Corporate Air Hangar	100' x 120'	Aircraft Storage and Maintenance	Good
Air One, Inc., Terminal	50' x 80' (2 floors)	Lounge, Restaurant, Offices	Excellent
Air One, Inc., Hangar	120' x 180'	Aircraft Storage and Maintenance	Excellent
Air One, Inc., Shop Addition to above	40' x 104'6"(2 floors)	Shop Area	Excellent
Corporate Air Office	40' x 70'	Corporate Air Offices and Airport Manager Offices	Good
State Hangar	68'2" x 120'	Equipment Storage	Fair
Fire Apparatus Building	47'2" x 66	Maintenance Vehicle and CFR Equipment Storage	Good
Connecticut DOT	2-50' x 100' (2 floors)	CTDOT Bureau of Aeronautics-Offices	
Connecticut National Guard	100' x 200'(3 floors)	Connecticut National Guard - Offices	Good
	100' x 115'	Vehicle Storage	
CRF Radio	32'6" x 36' 4"	Maintenance Equipment Storage	Good

TABLE 1-3
HARTFORD BRAINARD AIRPORT
PARKING APRON INVENTORY AS OF JUNE 12, 1985

Apron	Dimensions	Use	Surface	Condition
North of T-hangars	400' x 400'	Based Aircraft Parking	Bituminous Concrete	Poor
North or Cross Country Aviation Fuel Pumps	245' x 200'	Itinerant Parking	Bituminous Concrete	Poor
West of Txy A, North of Txy J	150' x 1,150'	7 Spaces Corporate Air Rest is itinerant parking	Bituminous Concrete	Ok, but poor north end
North of Corporate Air Hangar	350' x 400'	Based Aircraft Parking	Turf	Good
Air One Terminal	50' x 80'	Private Use	Bituminous Concrete	Good
N. of Air One Hangar	60' x 78'	Private Use	Concrete	Excellent
S. of Air One Hangar	20' x 78'	Private Use	Concrete	Excellent
No. Of Air One Hangar	160' x 220'	Fueling Area, Itinerant Parking & Multi-Use Parking	Bituminous Concrete	Poor, Being Overlaid
CT National Guard	120' x 200'	Access to Taxiway H from State Hangar	Bituminous Concrete	Poor

Source: VN Engineers, Inc.

Aviation buildings, west and south of the Corporate Air hangar, and parallel to Runway 2-20 at the end of Taxiway J, east of the Air One, Inc., office building, east and north of the Air One, Inc., hangar and between the Air One, Inc., office building, east and north of the Air One, Inc., hangar and between the Air One, Inc., hangar and the State hangar. A turf aircraft tie-down area is located north of the Corporate Air hangar. East of the southernmost aircraft parking area and south of the helicopter landing is an area for helicopter parking. Air One, Inc. has recently negotiated with CTDOT to construct a helicopter landing pad and six-space helicopter parking area east of the Air One, Inc. hangar and between taxiways "H" and "E".

1.2.3.3 Fuel Storage

Aviation fuel is stored at three locations at the airport. Cross Country aviation has a 12,000 Avgas 100LL fuel tank and 10,000 gallon Jet-A fuel tank and hydrants located east of their hangar.

Cross Country Aviation also dispenses fuel to aircraft with 3,000 gallon and 1,200 gallon Jet-A fuel trucks and a 1,200 gallon 100LL fuel truck. Corporate Air stores fuel in a 10,000 gallon 100LL tank and disperses 100 LL Avgas to aircraft with a 1,200 gallon fuel truck. Air One, Inc. has two 12,000 gallon Jet-A tanks and fuels turbine aircraft with a 1,200 gallon Jet-A fuel truck. Air One, Inc. also has one 12,000 gallon 100LL fuel tank and dispenses Avgas with a 500 gallon fuel truck. CTDOT has a 2,000 gallon gas tank and a 2,000 gallon diesel fuel tank with pumps to dispense fuel to their vehicles.

1.2.3.4 Airport Maintenance and CFR Equipment

A list of significant airport equipment, its condition and where it is located is shown on Table 1-4. The equipment is stored in either the State hangar, the Fire Apparatus Building or CFR Radio Building.

1.2.3.5 Auto Parking

Auto parking areas are located at numerous points at the airport. Table 1-5 lists auto parking areas use and approximate capacity.

1.2.3.6 Services

Services found at the Hartford Brainard Airport are provided by the various tenants at the airport which include the Federal Aviation Administration, Cross Country Aviation, VIP, Corporate Air, Air One, Hartford Helicopters, Alpha Air Services, Centerline Aviation and Civil Air Patrol as described below:

Federal Aviation Administration

Air Traffic Control Tower - VFR control tower. The Brainard Tower provides visual separation and servicing of arriving, departing and overflying aircraft through its area of jurisdiction. The Brainard Tower also controls ground traffic at the airport on the aircraft movement areas which include the runways and taxiways.

Cross Country Aviation

Cross Country Aviation, an FBO at the airport with 25-30 employees, provided the following services:

- Flight instruction, aircraft rental, scheduled air taxi Part 135 helicopter service and airplane and helicopter service.
- Aircraft fueling; Avgas 100LL and Jet-A.
- Major airframe and powerplant A&P maintenance on airplanes and helicopters.
- Aircraft parts sales and aircraft storage.
- Cross Country Aviation is applying for commuter airline designation to operate a helicopter passenger service between Hartford, New Haven and New York City.
- Terminal building providing a pilot lounge, lunchroom classrooms.

VIP

VIP is a subcontractor to Cross Country Aviation and repairs and installs aircraft instruments. They have two full-time employees.

Corporate Air

Corporate Air operates a nationwide air freight service which is headquartered in Hartford, Connecticut. Corporate Air at Brainard operates under FAR Part 135. Corporate Air has two subsidiaries operating under FAR Part 121: Viking International based in Minneapolis, Minnesota and Brennan and Hargraves based at Bradley International Airport in Windsor Locks, CT. Corporate Air at Brainard operates 28 single engine, multi-engine and turboprop aircraft and has 35 employees.

Air One, Inc.

Air One, Inc. provides Avgas and Jet-A fueling services, operates an independent rental car service, restaurant and lounge. Air One, Inc. also serves as landlord to a number of separate companies at the airport all of which are owned by the owner of Air One, Inc. Air One, Inc. has 22 employees.

Hartford Helicopter

Hartford Helicopter, a lessee of Air One, Inc. provides helicopter turbine maintenance and helicopter maintenance management and is applying for a helicopter certificate. Hartford Helicopter has 22 employees.

Alpha Air Services

Alpha Air Services, a lessee of Air One, Inc. provides airplane management, airplane charter services, operates four aircraft and has nine employees.

Centerline Aviation

Centerline Aviation, a lessee of Air One, Inc., operates a flight school, rents fixed wing aircraft and provides fixed wing system maintenance services with five aircraft and nine employees.

Other Services

Other services provided by operators not based at the airport include RIA, a subsidiary of Resorts International who operates a scheduled Sikorsky S-61 (twin turbine powered helicopter with 24

passenger seats) service between HFD and the West 30th St. Heliport in New York City. Hartford Helicopters personnel provide all ground services for RIA at HFD. Reney Tours from New Britain, Connecticut operates two round trips per week in CASA 212 (twin turbine powered fixed wing aircraft) aircraft between HFD and Atlantic City. The Civil Air Patrol (C.A.P.) operates from a trailer at the airport. The C.A.P. at Brainard Airport has 60 members, three single engine aircraft and provides flight instruction for some of its members, and classes on search and rescue as well as actual search and rescue services.

Hartford Brainard Airport is owned and operated by the State of Connecticut, governed by the Department of Transportation, Bureau of Aeronautics and operated by the Airport Manager who reports to the Bureau of Aeronautics, Director of General Aviation.

Airport maintenance is performed by an eight man maintenance crew. The Crew Leader reports directly to the Airport Manager and is responsible for daily pavement repairs, replacing airfield lights, maintenance of the airfield and assigning maintenance personnel their duties. Seven maintenance personnel maintain the airfield and airfield equipment as directed by the Crew Leader. Maintenance personnel are on duty 24 hours per day on week days and 14 hours per day on Saturday and Sunday.

Crash Fire Rescue (CFR) Services are provided primarily by the City of Hartford and the Brainard Crew Leader and maintenance personnel using CFR equipment described in Section 1.2.3.4. The Crew Leader is a certified Emergency Medical Technician (EMT). Four of the maintenance personnel are in medical technician training at this time. Airport CFR personnel receive periodic training by the Fire Chief at Bradley International Airport. At least one maintenance employee is usually on duty or at close proximity to the CFR Maintenance building during working hours, (8 AM-3:30 PM). The City of Hartford Fire Department also responds to aircraft emergencies and structures fires at the airport from Engine Co. No. 10, 1 3/4 miles from the airport. Response time to the airport is 4 minutes. The Hartford Hospital is 3 miles northwest of the airport in Hartford.

The Hartford Brainard Airport has security coverage from 4:30 PM - 7:30 AM Monday - Friday, and 9:00 AM - 4:30 PM on Saturday and Sunday. The Airport Manager indicated there are plans to soon add a 12:00 PM - 9 AM shift on weekends.

1.2.4 Miscellaneous Airport Facilities

1.2.4.1 Introduction

This section contains a description of miscellaneous airport facilities including ground access, drainage and utilities.

1.2.4.2 Ground Access

From U.S. Interstate Route 91 southbound, access to the airport is via US Route 5 and State Route 15 known as the Wilbur-Cross Highway, exit onto Murphy Road, northbound onto Maxim Road then eastbound to Airport Management, CTDOT Bureau of Aeronautics offices or the Connecticut National Guard, and a right turn onto the airport access road to the FBO terminal and control tower areas. From US Interstate Route 91 northbound access to the airport is via the exit west of the Metropolitan District Commission (MDC) sewage treatment plant directly onto Murphy Road then via the same route as from Interstate 91 southbound.

1.2.4.2 Drainage

Drainage of surface runoff is handled by a system of underground conduits which have been added at different times to the old system. Surface runoff is directed to the underground conduits by a system of catch basins. Catch basins are located along the entire length of the access road it the aprons and either side of the runways and some taxiways, apparently connected to the old underground conduits which apparently empties into the Connecticut River. No flooding problems have been reported at the airport. The airport and areas to the north are protected from flooding of the Connecticut River by the Clark Dike.

1.2.4.3 Utilities

Utilities serving the airport include water, electrical, gas and sanitary sewer which are discussed below.

Water

In Hartford, water is provided by Connecticut Water Company. Water is provided to the airport through an 8" Tyton water main east of the airport access road and south of Maxim Road with service laterals to buildings.

Electrical

Electrical power is provided to the airport from Northeast Utilities HELCO utility poles located west of the airport access road from Maxim Road to west of the FAA control tower. These

powerlines carry 3 phase 23,000 V phase to phase 13,200 volt phase to ground. Service to airport buildings is through underground cables from the utility poles mentioned above.

Gas

Gas service to the airport is also provided by Northeast Utilities through 4" and 6" 55-350 p.s.i. gas main located beneath the airport access road. Service laterals from the main serve buildings along the airport access road and Maxim Road.

Sanitary Sewer

An 8 inch sanitary sewer is located parallel and south of the airport service road, beginning at the Control Tower to a pump station approximately 350 feet north of the Cross Country Aviation hangar. The Control Tower, Cross Country Aviation and Corporate Air buildings east of the airport access road are served by this sewer. From the pump station south of the airport access road to north of Maxim Road is a 4" force main which transports sewage north from the pumping station. When the Air One, Inc. buildings were constructed, a 6" sanitary sewer was installed from the pumping station 10' east of the 4" force main to west of the Air One, Inc. office building continuing to the Air One, Inc. hangar building. Airport buildings south of Maxim Road are served by laterals from a sanitary sewer north of Maxim Road which intersects with the 4" force main previously mentioned.

1.3 RELATED AIRPORT DATA

1.3.1 Terrain

Terrain at the airport is relatively level, between 10 and 20 feet MSL. The Clark Dike from the Charter Oak Bridge south to the Wethersfield town line is approximately 45 feet MSL. Terrain west of the airport to US Route 91 is at 10-20 feet MSL. From Ledyard Street west, terrain inclines to 50 MSL at Wethersfield Ave. and 100 feet at Campfield Avenue. Terrain in the airport vicinity is more particularly analyzed through photogrammetry processes in Chapter 3 - Demand/Capacity.

1.3.2 Soils

Design and as-built drawings were reviewed to present a cursory description of soils at the airport. Topsoil at the airport is 2"-4" deep. Beneath the topsoil is a layer of brown silt and fine sand 6-14 feet deep. Beneath the layer of brown silt and find sand at the northern and southern extremes of the airport is a layer of fine brown sand. A detailed soils analysis based on soil borings is included in Chapter 3 - Demand/Capacity.

1.3.3 Property Boundaries

As shown on Figure 1-3, the northern boundary of the Hartford-Brainard Airport is south of Maxim Road. The eastern airport boundary is 60-70 feet west of the Clark Dike toe of slope. From Clark Dike, the southern airport boundary runs immediately south of Runway 2 and 275 feet south of Runway 11-29 to Brainard Road. The airport boundary then runs south of Brainard Road until 300 feet north of Runway 11-29, parallel to Runway 11-29 until 1,100 feet west of Runway 2-20 approximately 20 feet north of the airport access road to Maxim Road.

1.3.4 Easements

A 30' x 750' right-of-way transversing the airport from its southern boundary and across Runway 11-29 and Taxiway B east of Taxiway V is held by the Metropolitan District Commission. There appears to be an easement line along the toe of slope on the western side of Clark Dike as indicated on 1959 as-build drawings. Further research has not determined the conditions of the easement, and who holds the easement if it is in fact still in place.

1.3.5 Airspace

1.3.5.1 Airport Imaginary Surfaces

In accordance with Federal Aviation Regulations (FAR) Part 77, there are so called imaginary planes and surfaces in the immediate vicinity of Hartford-Brainard Airport. These surfaces define the limits of a volume of airspace. It is desirable to reserve all of the airspace above these imaginary surfaces for the operation of aircraft, either during normal operations (i.e.

1.5 ENVIRONMENTAL REVIEW

Chapter 6 contains an analysis of all environmental characteristics of the airport and surrounding environs. Therefore, this section only provides a cursory overview of the following environmental issues: (1) flood plains and regulations, (2) wetlands and woodlands, (3) noise and regulations, (4) air quality regulations, (5) water quality regulations, (6) historic and archaeological sites, and (7) construction standards.

1.5.1 Floodplains and Regulations

The Connecticut River, situated in a north-south orientation, separates Hartford and East Hartford and is the dividing line between various other communities, including Wethersfield and Glastonbury south of the airport. Extensive flood plains, many within the 100 year flood boundary, are located throughout several areas of the Capitol Region and in the vicinity of airport property itself, which borders the river. Dikes have been built along the banks of the river to inhibit and control flooding. The elevation of the dike on the Hartford side of the river is higher than on the East Hartford side, as the City of Hartford paid the COE an additional sum to exceed minimum height standards.

The City of Hartford, as well as the nearby towns of East Hartford, Wethersfield and Glastonbury, have instituted development plans and zoning regulations designed to preserve the natural ecological system of flood plains and drainage courses, to minimize or prevent damage and destruction of property, and to promote and protect the health, safety and welfare of the citizenry. Further discussion of these local regulations and plans is found in section 1.6, Land Use and Zoning.

1.5.2 Wetlands and Woodlands

Wetlands not only function as important wildlife habitats, but additionally serve as flood control and water retention agents. In this regard, woodlands also merit awareness and recognition for their significance.

Within the City of Hartford there are several wetlands, two of which are near the airport in the South Meadows and South End neighborhoods. Although land uses vary considerably from district to district, Hartford has evolved into a highly developed metropolitan and residential city, and wooded lands are at a minimum. The Town of Wethersfield, adjacent to the southern boundary of Hartford, also has numerous wetlands, along with substantial parklands. Areas of marsh and swamp soils found in the westerly portion of the Town and have been managed with the significance of their ecology in perspective. Similar to Hartford, the Town of East Hartford has several acres of wetlands and parks. Recognizing the inherent value of these areas, policies have been developed to restrict and/or prohibit development in these natural resource areas. Glastonbury, with an extensive reserve of wetlands, watercourses and woodlands, has also provided for the protection of these open lands through easements and zoning regulations. Several acres in the western and southern portions of the Town are open lands with minimal development.

1.5.3 Noise and Regulations

The State of Connecticut Department of Environmental Protection (DEP) has formulated regulations pertaining to the control of noise wherein noise zones are classified according to land use. Exempted from compliance, however, is airport noise that is caused by aircraft flight operations which are specifically preempted by the FAA. Federal Aviation Regulations (FAR) Part 150 establish a standardized system of measuring aircraft noise

V. Proposed Construction (More than 5 Acres)

I-A Hartford-Brainard Airport

The Hartford-Brainard Airport was dedicated on June 10, 1921, and named after former Mayor Newton C. Brainard of Hartford. It has played a significant role in Connecticut's aviation history as the first "flying field" in the New England states, and the first landing spot for Charles Lindbergh's triumphant transcontinental tour of the U.S. aboard the "Lucky Lindy" after his historic solo transatlantic flight.

This well-maintained airport facility is located on a 201.58-acre site approximately two miles southeast of downtown Hartford with estimated annual operations of 162,981. It is an integral part of Connecticut's aviation system, not only for Greater Hartford, but for southern New England as well.

The Federal Aviation Administration recognizes the essential nature of Brainard, and as such has designated it as a "reliever" status to Bradley International Airport located 18 miles north.

Brainard has two primary tenants. Charter Oak Aviation, Inc. is the official Fixed Base Operator at the airport and provides fueling and line service, aircraft storage, flight instruction, aircraft maintenance, and other pilot amenities.

Charter Oak Aviation, Inc. also provides an aircraft charter and management company based in a 12,000 square-foot hangar, providing charter service for Hartford area businesses. Charter Oak Aviation, Inc. has recently completed development of a $500,000 15,000 square-foot Hangar/Office Complex on a 110,930 square-foot parcel. It provides additional Hangar/Office space for a growing number of tenants.

Aviation Services, Inc. is a subtenant of Charter Oak Aviation, Inc., and currently operates aircraft charter and management services. They are also proposing to meet the needs of hangar tenants by planning a Hangar/Office Complex. The complex will consist of 12,000 square feet on a 45,000 square-foot parcel. The estimated cost of this facility is $500,000.

Air One, Inc. is a multiple service general aviation commercial operator authorized to provide aircraft maintenance, fueling and line service, hangar storage, and air taxi service.

I-B GROTON-NEW LONDON AIRPORT

The Groton-New London Airport (formerly Trumbull Airport) was established as a State airport in 1929. During World War II, jurisdiction of the airport was given to the military. Under the military, the configuration of runways, taxiways and aprons was laid out and built, and has remained the same with only minor modifications through the present time. In 1948, ownership of the Airport reverted back to the State. The present terminal building was added in 1963, a full service restaurant was built in 1967, a crash/fire/rescue building was erected in 1969, and a new maintenance facility was added in 1989. The State is continuing to upgrade the services and facilities, making Groton-New London Airport a full service regional airport.

The Groton-New London Airport is located on Long Island Sound on 409 acres and serves the Southeastern Connecticut Region.

Two major airlines serve the Airport with flights to Philadelphia and Newark, and connections to over 50 cities in the United States and abroad, with an estimated 131,000 annual operations and 42,000 enplanements annually. There are two charter services, three flight schools, three rental car agencies, a major Piper Aircraft repair facility, a Restaurant and Lounge in the Terminal Building, and a public parking lot.

The Airport has two active paved runways, 5-23 and 15-33. Runway 5-23 is 5,000 feet long by 150 feet wide and Runway 15-33 is 4,000 feet long by 150 feet wide. In addition, the Airport has approximately 2.5 miles of taxiways and 23 acres of paved aircraft parking area. There is also a seaplane landing area located on the Poquonock River.

The Airport is also fully instrumented to handle air traffic in all weather conditions. Navigational aids include beacon light, VHF Omni Range (VOR), lighted wind cone Instrument Landing System (ILS) to Runway 5, VASI to Runway 23, REILS to Runway 5-23 and REILS to Runway 33.

The Airport is fully certified under the provisions of FAR Part 139 and maintains Index "A" Fire Fighting and Rescue Apparatus with fully trained fire security crews.

MAINTENANCE FACILITY

In 1987, the State of Connecticut broke ground for a new maintenance facility which was completed in May 1989. This project cost approximately $2.2 million and provides the Airport with better maintenance capabilities on a year-round basis.

The 10,000 square-foot facility has five drive-thru bays to accommodate two new snow removal vehicles, a snow blower, sander, and payloader.

This first-class facility has a sand and storage area, general storage area, machine room, administrative area, maintenance area, and a special equipment area. It is also equipped with an hydraulic lift to repair and maintain all the equipment.

PRIVATE DEVELOPMENT

Private developers, tenants and air carriers have also made a commitment to provide quality services and facilities. In 1989, the two airlines serving the airport introduced new aircraft and additional flights, and have made a commitment to serving this region. Other commuter airlines are also requesting information to serve the Airport.

In 1988, Columbia Air Services, Inc., the Fixed Base Operator, constructed a new $1 million hangar/office complex adjacent to the Airport's Rescue and Fire Righting (ARFF) building. This new 18,750 square-foot facility replaced their former building which was constructed in the 1940's.

The services provided by this facility include charters, maintenance, flight training, fueling, avionics, and aircraft management.

Jade Aircraft, Inc., a Multiple Services Operator on the Airport, is planning to construct a 50,000 square-foot hangar/office facility on a 4-acre parcel of land. Construction is scheduled for the Spring of 1991 at a cost of $2.5 million.

This facility will provide additional aircraft charter, aircraft management, maintenance, and flight training.

I-C WATERBURY-OXFORD AIRPORT

Construction of Waterbury-Oxford Airport began in 1967, and the Airport was officially opened on December 15, 1969. The Airport is located in the middle of the most industrialized and populated areas of Connecticut, serving the Naugatuck Valley Region.

The Airport is one of the busiest in the State, with an estimated 150,000 annual aircraft operations. Over 200 corporate and general aviation aircraft are based at this airport for business and pleasure flying.

Waterbury-Oxford Airport was built on 427 acres, and has two runways. The main runway used by all aircraft is an all weather Instrument Landing System/Distance Measuring Equipment (ILS/DME) runway 5000' x 100'. REIL lights are on the approach for Runway 36, and VASI for Runway 18. Runway 13-31 is only 2000' long and is primarily for smaller, light aircraft. An Automatic Weather Observation System (A.W.O.S.) is in use 24 hours per day.

At present, the Waterbury-Oxford Airport has one Fixed Base Operator, Keystone Aviation Services, Inc., providing a full line of services such as: flight instruction, aircraft sales, a complete major engine and air frame repair shop. Other services offered at the airport are aircraft parking and hangar rentals, capable of handling aircraft comparable in size to a Gulfstream II.

PRIVATE DELEVOPMENT

Development is continuous at the Waterbury-Oxford Airport. There is a commitment to maintain and upgrade the Airport into the best and most efficient aviation facility. This Airport continues to get better, but will never get bigger.

Keystone Aviation Services, Inc. held a ribbon-cutting ceremony in February 1990 to celebrate the completion of an additional 15,000 square-foot Hangar/Office Facility on a 62,700 square-foot parcel adjacent to their existing facility.

Keystone's newest facility provides aircraft management, charter maintenance, fueling, travel services, aircraft sales, and charter service.

Keystone is also planning to construct another 15,000 square-foot Hangar/Office Facility on their option parcel. Their aircraft management and charter maintenance business is booming and this project may begin in the Spring of 1991 to meet their increasing demand for aviation services.

Executive Flight Services, Inc. is a Multiple Services Operator at the Airport providing aircraft management, charters and rentals. They have just completed construction of a 3,600 square-foot Hangar/Office Facility. The first phase of development is completed and they have just started construction of an office addition which will be used as a "hospitality room" for their Atlantic City Charter clientele. The scheduled completion is planned for Spring of 1991.

I-D WINDHAM AIRPORT

Windham Airport is located in the eastern region of Connecticut, and was originally constructed and maintained by the town as a general utility municipal airport. In July 1975, it was purchased from the Town of Windham by the State for $1.00, thus making it the fifth State-owned General Aviation airport.

The Airport is a 237-acre well-maintained facility located 2.7 miles from the downtown community. In 1989, there were 38,800 annual aircraft operations and 80 based aircraft.

This Airport has three paved runways. Runway 6-24 was closed and is now used for aircraft tie-downs, with the two remaining operational runways 9-27 and 18-36 which are 4,280 feet and 2,800 feet in length, respectively. Navigational aids include a localizer/DME, beacon light, wind cone (lighted), obstruction lights, Unicom System and several hazard beacons.

The Airport has two primary tenants. Windham Aviation, Inc. is the Fixed Base Operator at the Airport and provides fueling, line service, flight instructions, and aircraft charter service. Aviation Associates, Inc. leases 10 "T" hangars to local pilots who base their aircraft at Windham.

I-E DANIELSON AIRPORT

Danielson Airport was established in 1962, and was originally developed as a small air strip used to accommodate aircraft serviced at the Harvard H. Ellis Regional Vocational Technical School. This school has a reputation of providing topnotch airframe and power plant mechanics.

This 260-acre airport has one paved runway which is 2,700 feet in length, a rotating beacon, runway lights controlled by Unicom, and a wind cone. In 1989, Danielson Airport had approximately 24,300 total annual operations. Over 59 aircraft are based at the Airport.

Danielson Airport has two primary tenants; D & D Aircraft Painting and Maintenance, Inc., Fixed Base Operator, provides fueling and line service, flight instruction, and aircraft charter service.

In August 1989, some local businessmen formed a company called Danielson "T" Hangars, Ltd. These men were interested in protecting their aircraft investment and developed 10 nested "T" Hangars consisting of 11,000 square feet on a 38,100 square-foot parcel at a cost of over $270,000.

II JUSTIFICATION FOR GROUP APPLICATION

The State of Connecticut, Department of Transportation, Bureau of Aeronautics, owns and directs the operations at six airports. They are located in Windsor Locks, Hartford, Groton, Oxford, Windham and Danielson. Of these, one (Bradley International at Windsor Locks) is operated as a separate enterprise and has filed for an NPDES Permit at an earlier date. The remaining airports are considered as General Aviation and are requesting a separate permit under the "group" provisions.

The activities at the General Aviation airports are directed by the respective Airport Managers who, in turn, are responsible to the General Aviation Coordinator. Since these airports are owned by the State, any and all activities are regulated via a "lease agreement" with an operator or tenant.

Since the activities at the five General Aviation Airports are similar and they are directed by the same office, it would be prudent to group them under this one application.

III LISTING OF MATERIALS STORED OUTSIDE

All the tenants and operators at State-owned airports are under a lease agreement with the State regarding their activities. Various Articles within the lease prohibit certain activities or practices. It is a requirement that the lease area be kept clean and uncluttered. As such, only those items specifically approved may be kept outside. In most cases, this includes storaged ethylene glycol and, of course, fuel farms.

The following is a listing, by airport, of materials stored outside -- including fuel farms.

A. HARTFORD-BRAINARD AIRPORT

Fuel Farms:

Four steel Jet A @ 6,000 gal. ea., installed 1985
Two steel 100 low lead @ 6,000 gal. ea., installed 1985
One steel auto diesel @ 4,000 gal., installed 1988
One steel auto unleaded @ 4,000 gal., installed 1988
One steel above ground Jet A @ 12,000 gal., installed 1989
One steel above ground 100 oct. low lead, installed 1989

Waste Oil:

Air One - 275 gal.
Charter Oak - 275 gal.

Ethylene Glycol:

Air One - 100 gal. storage and 50 gal. applicator *
Charter Oak - " " " " " " " *

* Items are stored inside, but applied outside.

B. GROTON-NEW LONDON AIRPORT

Fuel Farms:

Two steel underground Jet A @ 10,000 gal., installed 1973 - to be removed 1993
One steel underground @ 10,000 gal., 100 oct. low lead, installed 1973 - to be removed 1993
One steel underground unleaded, @ 4,000 gal., installed 1973 - to be removed 1993
One steel underground auto low lead @ 4,000 gal., installed 1989
One steel underground auto diesel @ 4,000 gal., installed 1989
One steel underground heating oil @ 2,000 gal., installed 1989
One steel underground heating oil @ 4,000 gal., installed 1962

Waste Oil:

Columbia - 275 gal.

B. **GROTON-NEW LONDON AIRPORT - Continued**

Ethylene Glycol:

USAir Express - 1,000 gal. storage and 500 gal. dispenser
Continental Express - 500 gal. dispenser **

** Operated under contract by the FBO (Columbia Air Services)

C. **WATERBURY-OXFORD AIRPORT**

Fuel Farms:

Two steel underground Jet A @ 20,000 gal., installed 1972
Two steel underground 100 oct. low lead @ 25,000 gal., installed 1972

Both of the above tanks are owned by Keystone Aviation and will be removed during CY 91-92 with replacements being relocated to the new fuel farm site.

One steel underground No. 2 fuel oil @ 2,000 gal., installed 1978
One steel underground unleaded auto @ 2,000 gal., installed 1972 - to be replaced CY 91
One steel underground auto diesel @ 550 gal., installed 1978 - to be replaced CY 91

Waste Oil:

Keystone - 500 gal.
Executive Flight - 275 gal.

Ethylene Glycol:

Keystone - 150 gal. dispenser

D. **WINDHAM AIRPORT**

Fuel Farms:

One steel low lead 100 oct. @ 10,000 gal., installed 1987
One steel Jet A @ 10,000 gal., installed 1987
One steel unleaded auto @ 2,000 gal., installed 1987
One steel auto diesel @ 2,000 gal., installed 1987

Waste Oil:

Windham Aviation - two 275 gal. drums

Ethylene Glycol is not used at this airport.

E. DANIELSON AIRPORT

Fuel Farms:

One steel unleaded auto @ 2,000 gal., installed 1960
One steel empty inactive @ 2,000 gal., installed 1960
One steel empty inactive @ 1,000 gal., installed 1960
One steel 100 oct. low lead @ 10,000 gal., installed 1960

All of the above four tanks have exceeded their 20-year life, and all will be removed and replaced within CY 1991 under Project No. 68-171.

Waste Oil:

D & D Aircraft - one 55 gal. drum

Ethylene Glycol:

Ethylene Glycol is not used at this airport.

IV. LISTING OF 10% OF THE DISCHARGERS

During Part II of the permit, the Bureau shall employ a consultant engineer to evaluate at a minimum of one discharger per airport. This number shall be increased if required. The locations or names for the test locations have not been finalized during this phase.

V. PROPOSED CONSTRUCTION

The Bureau of Aeronautics, under a grant from the Federal Aviation Administration, shall be constructing a project at Waterbury-Oxford Airport. The construction is expected to start in early spring of 1991. The project consists of the following:

1. Construction of a paved access road approximately 3,600 feet long by 28 feet wide.

2. Construction of paved automobile parking lot 243 feet by 60 feet and a paved drive approximately 420 feet long by 24 feet wide.

3. Construction, marking and lighting of Taxiway "F" (approximately 1,600 feet by 50 feet), Taxiway "E" (approximately 325 feet by 50 feet), and Taxiway "G" (approximately 325 feet by 50 feet).

4. Construction of an aircraft ramp (approximately 18,000 s.y.)

5. Construction of a 44-foot high ILS Localized Antenna Platform.

6. Installation of a water main along new access road.

7. Construction of detention basins and drainage structures as per inland/wetland permit.

Approximately 40 acres of land will be disturbed during construction of this project.

State of Connecticut, Best Management Practices for the Protection of the Environment, shall be employed during construction to control storm water discharges and to prevent erosion and sedimentation and to otherwise prevent pollution of wetlands or watercourses. Upon completion of the project, a schedule will be developed for the removal of sediment built up in catch basins and detention basins. Runoff from the paved aircraft ramp is being directed to a detention basin that has a hooded outlet to prevent the escape of fuel or oil in the event of a spill on the ramp.

As a result of the State of Connecticut inland/wetland permit process, an elaborate drainage design was done to limit flows from the project site at or near the existing conditions for the full build scenario for a 2-, 10-, 50-, and 100-year storm. This was done because of existing downstream flooding of Eight-Mile Brook and Jacks Brook.

STORM WATER POLLUTION PREVENTION PLAN

for

BRAINARD GENERAL AVIATION AIRPORT

Prepared for:
Connecticut Department of Transportation
Bureau of Aviation and Ports
P.O. Box 317546
Newington, CT 06131-7546

Prepared by:
Metcalf & Eddy, Inc.
860 North Main Street Extension
Wallingford, CT 06492

Overview

Brainard Airport was opened in 1921 and is located on a 200 acre site approximately two miles southeast of downtown Hartford. The airport has two operating runways (2-20 and 11-29), as well as several taxiways, hangars, maintenance buildings, charter facilities, and a Connecticut Army National Guard complex.

There are four storm water point discharges from Brainard Airport. These point discharges and associated drainage areas are identified on the site plan (Figure 1) as "Discharge A," "Discharge B, "Discharge C," and "Discharge D." Below is a brief description of each point discharge and the associated drainage area. Additional details for these discharges are given in Table 1.

Discharge A receives runoff from the major portions of the airport runways. Discharges are released through a 15-inch pipe to the Connecticut River. The primary features and activities located within the drainage area of Discharge A include: the northern portion of runway 2-20, associated taxiways and grassed infield areas, and the hangar areas west of runway 2-20, including the Million Air, Inc. hangars.

Discharge B also consists of a 15-inch pipe that discharges directly to the Connecticut River. The drainage area for this discharge includes: the southern section of Runway 2-20, most of Runway 11-29, and associated taxiways and infield areas. No airport building areas were observed to drain through this discharge.

Discharge C is connected to the Metropolitan District Commission (MDC) storm sewer system at the south-western end of the airport. The drainage area for this discharge collects runoff from the western end of Runway 11-29, associated airport taxiways and infield areas, and various airport buildings, including the T-hangars and control tower.

Discharge D is connected to the MDC sewage system at the northwestern end of the airport. The drainage area for this discharge includes ConnDOT office buildings, the Connecticut Army National Guard Facility, and other nearby office areas.

There are five primary tenants at the Brainard General Aviation Airport, including the Connecticut Department of Transportation (ConnDOT), Million Air, Inc., CT Air Group, Shoreline Aircraft Maintenance, Inc., and the Army National Guard. Due to the varying nature of tenant operations, building locations, and general responsibilities, the following site assessment is divided by tenant. For each tenant, brief descriptions of their operations/responsibilities, facilities, and equipment and material usage are provided. At the end

TABLE 1. DISCHARGE SUMMARY FOR BRAINARD GENERAL AVIATION AIRPORT (APRIL, 1993)

Discharge Code	Drainage Area	Type of Conveyance	Size	Material	Receiving Water or Drainage System	Comments
A	51-AC	Pipe	15"	Corrugated Metal	Connecticut River	
B	123-AC	Pipe	15"	Reinforced Concrete	Connecticut River	Discharge flows through a 10' wide canal entering the Connecticut River through a submerged pipe
C	79-AC	Pipe	21"	Corrugated Metal	M.D.C. Property Storm Drainage System	Discharge is connected to the parking lot drainage system at an MDC property
D	36-AC	Pipe	Unknown	Corrugated Metal	M.D.C. Storm Drainage System	Connected to storm drainage system located in Maxim Road

of each section, there is also an assessment of the tenants' facilities and operations as they relate to the SWPPP. It is emphasized that the information gathered during the site assessments was not intended to be comprehensive but was strictly limited to information required to develop the SWPPP. However, prior to assessing each tenant assessment, a few general issues which pertain to several of the tenants are discussed.

Material Loading/Unloading. In general, most significant materials are transported to the airport tenants in 55-gallon drums by delivery trucks. The materials are typically unloaded outside the tenant facilities and subsequently stored inside the hangars. On-site drummed materials are generally moved with hand trucks.

Product is delivered to the aviation, gasoline, and diesel fuel storage tanks by tanker trucks. Fuel is transferred to vehicles or equipment through dispensers located near the underground fuel storage tanks. Finally, aircraft fuel is removed from the underground tanks and delivered to aircraft by on-site tanker trucks.

Wastes. No known hazardous wastes were identified at Brainard Airport. However, non-hazardous Connecticut regulated waste CR02 (waste oil) is a common waste and is discussed in the individual tenant assessments.

Exterior Manufacturing/Process Areas. No exterior process areas exist at the airport.

Vehicle/Equipment Maintenance and Washing. Maintenance and washing of vehicles and equipment are discussed in the tenant assessments which follow.

Pesticides/Fertilizers. No pesticides, fertilizers, or herbicides are knowingly used at the airport.

Erosion. There were no erosion problems observed at the airport during the site assessment.

Dust/Particulate Generating Processes. No dust or particulate generating activities were identified at the airport.

ConnDOT

Operation/Responsibilities. The Connecticut Department of Transportation owns and is responsible for the general management of the airport. They provide general maintenance of the airport, including mowing grass, snow plowing, and maintenance of mechanical and physical properties such as the runways and navigational aids. ConnDOT also provides fire emergency response services for the airport.

Facilities. There are two ConnDOT facilities of concern at Brainard Airport: the fire facility and the DOT maintenance garage. All other ConnDOT facilities on site only contain offices. The fire facility is located at the far northern end of the airport and contains administration offices and an attached vehicle garage. The fire equipment is kept inside the garage most of the time. The ConnDOT maintenance garage is also located at the far northern end of the airport. This facility consists of office space and a vehicle garage. In addition, ConnDOT operates a sand storage shed located at the north end of Runway 2-20.

Materials and Equipment. Equipment kept and maintained by DOT at Brainard Airport includes a fire fighting truck and various dump trucks, snow plows, and front end loaders. This equipment is used in the regular maintenance of runways, primarily during the winter months.

Based on site visit observations and information provided by airport officials, materials typically handled and stored by ConnDOT include motor fuel, heating oil, waste oil, cleaning solvents, ethylene glycol, and fire fighting foam. A complete list of materials used on site is kept in Material Safety Data Sheet (MSDS) records which are located in the fire facility. Motor fuel is stored in two 4,000-gallon underground storage tanks located outside the ConnDOT maintenance facility. One tank contains low lead gasoline and the other contains diesel fuel. A fuel dispensing island is also located in this area. Waste oil, mineral spirits, and paint are located inside the maintenance garage in closed 55-gallon drums.

Sand is stored and used by ConnDOT during the winter months. The sand is located near the Army National Guard facility and is stored in an enclosed building that is typically opened during sand deliveries and winter use. Sand is used on the runways and taxiways should snow and ice accumulate on these surfaces.

Assessment. All materials, with the exception of the motor fuels, are stored within the maintenance garage or fire fighting facility. Two floor drains exist in the firefighting facility and one in the maintenance garage. These large floor drains with sumps were installed in 1995 and are connected through an oil/water separator to the sanitary sewer.

ConnDOT does not perform regular maintenance on the state vehicles kept at the airport. The motor oil and cleaning solvents stored on site are used only for periodic "topping-off" of vehicle

fluids and periodic cleaning of equipment. Not unlike similar trucks and equipment, most of the vehicles leak small amounts of fluids. The leaking fluids are typically collected with absorbent pellets and disposed of with other wastes.

Refilling of underground fuel storage tanks and the subsequent fueling of vehicles is concentrated in the area of the maintenance garage. No reported spills were identified during the site assessment, and there was no visual indication of spills. Any large spill occurring in the fueling area would most likely be directed to a catch basin located downgradient of the fuel island. Due to the proximity of the catch basin to the fueling area, a spill could result in releases of fuel to surface waters of the area.

The sand storage area could be a potential source of storm water pollution. However, during the site visit, the area surrounding the sand shed was clean and well maintained. Because the sand is located in an enclosed facility that is only opened during sand delivery or sanding operations, this source may not pose a significant pollution problem.

Connecticut Army National Guard

Operations/Responsibilities. Brainard Airport houses a Connecticut Army National Guard facility/hangar that is currently used for equipment and vehicle storage and office space. A vehicle repair garage that occupies the northeast corner of the facility is no longer in use but remains intact.

Facilities. The Army National Guard facility consists primarily of a maintenance hangar with attached office space. The building is located at the north end of Runway 2-20. An extensive outside storage area is located next to the main building. Located in this storage area is a large gravel vehicle parking area, a canopied vehicle washing station, and two large storage sheds used for waste materials. In addition, various waste oil and vehicle fuel tanks exist in the same storage area.

Materials and Equipment. The former National Guard repair and maintenance facility still contains storage of waste oil and dirty rags in 55-gallon drums located inside the building. Additional storage of materials exists outside the building in a large fenced-off storage area. This area contains a 275-gallon double wall above ground waste oil tank and an abandoned above ground waste oil tank. Two underground storage tanks (USTs) are located within the storage area: one containing unleaded gas and the other containing diesel fuel. These two USTs provide fuel to a fuel island which has two dispensers: one for gasoline and one for diesel fuel. Connecticut Army National Guard vehicles are fueled at this location. Also, two large storage sheds are used to store vehicle oil.

A 5,000-gallon underground heating oil tank is located just outside the facility. This tank provides heating fuel for the maintenance building and the attached offices.

Assessment. Most of the materials used by the National Guard are stored in sheds which are

located in a fenced-off storage area. These materials do not appear to be exposed to storm water and most likely do not pose a storm water pollution threat. An above ground waste oil tank, with no secondary containment, is also located in this area. The maintenance garage has two trench floor drains running the length of the facility. There is no indication of where these floor drains discharge.

Operations at the National Guard facility appear to adhere to good housekeeping practices. Observed floor surfaces were clean with no evidence of spills. Also, observed work surfaces were clean and well maintained. Fuel delivery areas include the two underground tanks located in the storage area and the one underground heating oil tank located near the maintenance garage. There were no observed indications of fuel spills in these areas. However, the heating oil tank is located near catch basin systems that could receive any spill that did occur. The two vehicle fuel tanks are on unpaved areas with no nearby drainage system.

Vehicle washing at the National Guard facility now takes place in a newly constructed vehicle washing station. The station is canopied and all wash water is collected and discharged through a 1,500 gallon oil water separator to the sanitary sewer system.

Million Air, Inc.

Operations/Responsibilities. Million Air, Inc. is the Fixed Based Operator (FBO) for Brainard Airport. As the FBO, Million Air provides fueling and line services, aircraft storage, flight instruction, aircraft maintenance, and other services. Million Air operates two fuel farm facilities and mobile fuel trucks to provide aircraft fueling services. Million Air is the only fuel service operator at Brainard.

Facilities. Million Air operates and maintains three aircraft hangars. The aircraft hangars are located on the west side of Runway 2-20. The buildings consist of a large aircraft hangar designated as Million Air North and two hangars, one with attached office space designated as Million Air South.

In addition to the equipment used for general maintenance, Million Air owns aircraft refueling trucks. The trucks are generally parked on the apron area outside the hangar when they are not being used for refueling. These trucks are filled from one of two fuel farms. The first fuel farm consists of two 12,000-gallon above ground fuel tanks located at the far northwestern end of the airport. One of these tanks contains Jet A aviation fuel and the other contains 100 octane low lead fuel. It is estimated that approximately 500,000 gallons of aircraft fuel is used from these two tanks annually.

Million Air also operates a second fuel farm which has six 6,000-gallon underground tanks. The underground tanks are located just south of the above ground fuel farm. It is estimated that approximately 500,000 gallons of fuel are dispensed from these tanks annually.

Million Air South

Facilities. The two buildings that comprise Million Air South include a leased aircraft storage hangar, and a larger hangar with attached offices and avionics shop.

Materials and Equipment. Some general aircraft maintenance is performed in the main hangar but, this is primarily restricted to oil changes, minor painting, and other regular aircraft maintenance. Materials stored on site during the site visits included waste oil, detergents, and ethylene glycol. Additionally, VIP Aero, an avionics company, operates out of this hangar as a tenant of Million Air.

Assessment. All of the observed materials used by Million Air, except for the aircraft fuel, are stored inside the hangar. A floor drain trench is located in the middle of the hangar. These floor drains are currently being connected to an oil/water separator with discharge to the sanitary sewer, as shown on the site plan (Figure 1).

Currently aircraft washing at this facility occurs both inside the hangar and on outside aircraft tie-down areas and aprons. When washing is performed outside, rinse water is carried to both the drainage system and the grassed areas located between runways and along taxiways.

Observations of the fuel farm areas did not indicate evidence of spills or leaks. The new fuel farm area consists of above ground tanks with 110 percent secondary containment. Spills in this area are directed to a catch basin connected back into the containment area. There have been no reported spills or leaks of fuel from this area in the past five years. However, a potential problem exists with the mobile fueling trucks. When they are not in use, they are parked on a paved area just north of the Million Air hangars. This parking area is in direct line with a storm drainage system which discharges to the Connecticut River. The above ground waste oil tank located outside the Million Air hangar does not have secondary containment but is reportedly scheduled to be replaced with a double wall tank in January 1996.

In addition to fueling activities, aircraft deicing is performed by Million Air. Deicing is performed in the hangars. According to airport personnel, about 20 to 50 gallons of deicing fluid (½ ethylene glycol and ½ water) are used on a yearly basis. The preferred method for deicing is the "warming-up" of aircraft inside the hangar.

Maintenance areas appeared clean and well maintained. Floors also appeared clear of obstructions.

Million Air North

Facilities. Million Air North is comprised of one aircraft hangar located on the west side of Runway 2-20 and an office building with a restaurant.

Materials and Equipment. Some general aircraft maintenance is performed in the Million Air

North hangar by CT Air Motive, a subtenant but, this is primarily restricted to routine maintenance and washing. Waste oil, detergent, and ethylene glycol are stored in the facility in 55-gallon drums. In addition, a 275-gallon above ground waste oil tank is located outside the maintenance building near the fuel farm.

Six floor drains are located in the facility. The floor drains discharge to a holding tank that is periodically pumped and disposed of by an approved waste contractor. The floor drains primarily collect wash waters generated during aircraft washing.

Assessment. Materials and equipment used and stored at Million Air Inc. do not appear to pose a significant source of storm water contaminants. The fuel farm consists of underground tanks and no drainage system is located nearby. The potential for spills to enter the drainage system from this area appears to be minimal. Additionally, the floor drain system discharges to a holding tank. The most significant potential for pollutant discharges from this facility appears to be the above ground waste oil tank. The waste oil tank does not have secondary containment to protect against leaks or spills.

CT Air Group

Operations/Responsibilities. CT Air Group is a subcontractor of Million Air. CT Air Group operates an aircraft charter and management service. As of November 17, 1995, CT Air Group has not officially started operations at Brainard. Because CT Air Group was not operating during the November 1995 site visit, no assessment of their operation is included in this SWPPP.

BRAINARD GENERAL AVIATION AIRPORT
POTENTIAL POLLUTION SOURCES
(Based on 11/17/95 site visit)

General Information

During the November 17, 1995 site visit, the following potential pollution sources were observed at Brainard Airport:

- Floor drains at the Army National Guard maintenance hangar discharge to unknown locations. No plans for this facility were available for review. Therefore, these floor drains pose a potential to contribute pollutants to ground or surface waters.

- No stains were evident at the aircraft or vehicle refueling areas. However, the potential for spills or leaks does exist. This could be a potential problem, especially with the ConnDOT vehicle fueling island and the Million Air, Inc. mobile aircraft fueling trucks. Catch basins that connect to the airport drainage system are located immediately downgradient of the ConnDOT fueling island. Also, the mobile fuel trucks generally park on an aircraft tie-down area near drainage system catch basins. Potential leaks or spills in these areas may discharge to the Connecticut River before being contained.

- According to airport personnel, deicing activities at Brainard Airport are performed inside hangars. However, runoff from the facility, during the winter months, may be contaminated with glycol based deicing fluids which have spilled on paved surfaces. Although glycol based fluids are used sparingly at this airport (an estimated 20-50 gallons per year) this may be a source of storm water pollution.

- Outside storage of waste oil in above ground tanks is prevalent throughout the airport. The primary locations for waste oil storage are behind the Army National Guard facility and near the Million Air North hangar. In addition to the waste oil storage, waste gasoline is stored in sealed 55-gallon drums at both aircraft fuel farms. Reportedly, drums and tanks are sealed to prevent material contact with storm water. However, secondary containment to protect surface and ground waters in the event of a tank leak do not exist for these waste products.

- Aircraft and equipment washing with an industrial degreaser/detergent is a common practice of the tenants at Brainard Airport. Washing is generally performed outside in grassed areas on clear, warm weather days and inside the hangars when raining or cold. The cleaning agent and resulting wash water may contribute contaminants to receiving waters if washing is conducted outside. When washing is performed in the hangars, the wash water is discharged through the floor drains.

- Vehicle fueling at the Connecticut Army National Guard takes place on an unpaved apron. Based on this observation, the potential exists for spills from overfilling or other

sources to introduce contaminants to the environment.

A summary of the potential pollution sources described above is provided in the accompanying tables. These tables also include a listing of existing management practices used to mitigate the affects of the potential pollutant sources. Finally, suggested best management practices which could be used to control the pollutant sources are included.

Material Inventory and History Data

All materials stored at the airport also pose potential pollution problems. The above discussion called particular attention to the materials stored outside in 55-gallon drums and above ground tanks. However, even materials stored inside can cause storm water runoff pollution during its delivery or use.

A list of potential pollutants also includes materials stored at the airport. To help maintain an inventory and history of these potential pollutant sources, three tables are included in this section. These tables are: 1) Material Inventory; 2) Exposed Significant Materials, and; 3) Significant Leaks and Spills. A brief description of the purpose of each table is provided below. The tables have been completed with information gathered during the site assessment. These tables should be reviewed and updated as part of the semi-annual inspection.

Material Inventory. The material inventory list is used to identify materials that are handled, treated, stored, or disposed of at Brainard Airport. The enclosed list is based on information gathered during the initial site assessment and are typical of the materials used on-site. In addition to identifying the materials at the airport, the "Material Inventory" table also summarizes the assessment of the potential for exposure of each material to storm water.

Exposed Significant Material. This table is a follow-up to the material inventory list. This table lists significant materials that are exposed to precipitation, identifies the quantity and locations of the materials, identifies the method of storage for the material being exposed, and describes the current management techniques used to minimize contact between materials and precipitation.

Significant Leaks and Spills. Leaks and spills of materials, if not contained quickly and cleaned-up thoroughly, may result in the release of pollutants to storm water. This table is a summary of significant (greater than 5-gallons) leaks and spills at the airport. The General Permit requires that a three year summary of significant leaks and spills be maintained. Therefore, this list must be updated annually. Based on information gathered during the site assessment, no significant leaks and spills were recorded at the site.

BRAINARD GENERAL AVIATION AIRPORT POTENTIAL POLLUTANT SOURCE IDENTIFICATION	Completed by: Metcalf & Eddy, Inc Title: Consultant Date: November 17, 1995

ctions: List all identified storm water pollutant sources and describe existing management practices that address those sources. In the third column, list BMP options that can be incorporated into the plan to address remaining sources of pollutants.

Storm Water Pollutant Sources	Existing Management Practices	Description of New BMP Options
Gasoline and diesel fuel at ConnDOT fueling station	None known	• Provide raised berm around catch basins down gradient of fuel island if practical. • Avoid "topping-off" vehicles during fueling operations. • Use portable mats to cover down-gradient catch basin during vehicle fueling operations.
Gasoline and diesel fuel at the CT Army National Guard fueling station	None known	• Pave apron around fuel island. • Avoid "topping off" vehicles during fueling operations.
Fuel truck parking area and aircraft fueling operations	None known	• Park full refueling trucks away from catch basins and drainage system if possible. • Use portable mats to cover catch basin inlets near aircraft during refueling operations.
Wash water from aircraft cleaning	None known	• Only perform washing inside hangars which have floor drains discharging to holding tanks or to sanitary sewer.
Deicing activities	None known	• Perform deicing only inside hangars which have floor drains discharging to holding tanks or sanitary sewers.
Above ground waste oil tanks	None known	• Provide secondary containment.
Fuel, motor oil, hydraulic oil at all maintenance facilities	Use absorbent pellets to collect drippings	• Service equipment to minimize drips.

State Project No. 63-536
Storch Associates Reference No. 04-5429-120

I. INTRODUCTION

The Connecticut Department of Transportation (ConnDOT) has proposed a ramp reconstruction project for a portion of Brainard Airport in Hartford, Connecticut. The airport property is occupied by office buildings, a National Guard Armory, storage hangars, maintenance hangars, a maintenance garage, an airport fire station, aircraft parking and fueling areas, and a runway/taxiway system. The potential exists for the release to the environment of petroleum products and/or hazardous materials. A Task 120 - Preliminary Site Evaluation was authorized by ConnDOT and has been completed by Storch Associates. This report contains the results of the evaluation.

The property, located on Maxim Road in Hartford, is identified on Tax Assessor's Map 232 as Lot 1 in Block 3. The parcel is owned by the State of Connecticut.

II. PROJECT DESCRIPTION

According to the project information provided by ConnDOT, the proposed project involves "ramp reconstruction" in an aircraft parking area north of a group of three storage hangars which are located in the central portion of the airport property. The existing pavement includes a helicopter landing pad. The information provided by ConnDOT does not include a detailed project description.

III. EVALUATION METHODOLOGY

In accordance with Storch Associates' Scope of Services Contract dated April 15, 1994, and the Connecticut Transfer Act (Section 22a-134), the following sources were utilized to assess environmental conditions on the subject site:

- Identification of the geological and physiological characteristics as well as identification of potential environmental receptors.

- Historical records were reviewed to identify any past land usage which may have negatively impacted environmental conditions at the subject site. Sources referenced include old land records, aerial photographs, Price and Lee City Directories and Sanborn Fire Insurance Maps.

- Federal, State and local files were reviewed to collect site information and relevant agency data. The Connecticut Department of Environmental Protection (CTDEP) records were researched in the following offices: Oil and Chemical Spills, Underground Storage Tanks (USTs), Water Management and Waste Management. Hartford city officials were contacted in the following offices: Planning and Zoning, Building, Fire Marshal and Health Department.

- A site visit was conducted to observe and record existing operating conditions and to interview persons knowledgeable of facilities and operating conditions on the property.

IV. SITE INFORMATION

A. Property Data

The referenced property is shown on the U.S. Geological Survey (U.S.G.S.) Map, South Hartford Quadrangle, in Appendix A. The parcel is approximately 80 hectares (198 acres) in size, according to information from the assessor's office, and is identified on Tax Assessor Map 232, Block 3, Lot 1. The subject site is located on Maxim Road and is served by public water/sewer.

B. Groundwater Classification

The groundwater in the vicinity of the subject property, as categorized by the "Adopted Water Quality Classifications for the Connecticut River Basin" map (February, 1993), is classified as "GB". Class "GB" indicates that the groundwater may not be suitable for direct human consumption due to waste discharges, spills or leaks of chemicals or land use impacts. The groundwater is located within highly urbanized areas of intense industrial activity and where public water is available.

C. Surface Water Classification

The surface water classification for the Connecticut River, located adjacent to the eastern boundary of Brainard Airport, is Class SC/SB. This indicates that the surface water is presently not meeting Class "SB" water quality criteria for one or more designated uses. Designated uses include recreational use, fish and wildlife habitat, industrial supply and other legitimate uses, including navigation. The goal is to upgrade to class "SB".

D. Proximity of Public Water Supplies

The "Atlas of the Public Water Supply Sources & Drainage Basins of Connecticut", 1982, was reviewed for the location of private/public wells within a one-half mile radius of the referenced property. No private/public wells are located within this radius.

E. Geological Information

According to the "Soil Survey for Hartford County", February, 1962, (General Soil Map) the subject property is classified as "Ma - Made land". This land occurs where the surface soil and subsoil have been stripped, and where earth, trash, or both are used as fill material.

According to the "Bedrock Geological Map of Connecticut", 1985, bedrock in the study area is classified as "Jp" - Portland Arkose, a reddish brown arkose commonly known as brownstone.

V. OVERVIEW OF SITE HISTORY

- Aerial Photographs

  Aerial photographs, available in five year increments from 1965 to 1995 at the Connecticut Department of Environmental Protection (CTDEP) offices, were reviewed between April 29 and May 1, 1997. The 1965 photograph shows the original size of the airport and depicts one aircraft hangar in the center of the airfield, in the southern portion of the airport property, in the proposed project area. This hangar appears to be the hangar which is adjacent to the southern boundary of proposed ramp reconstruction. The remainder of the southern and central portion of the airfield in the 1965 photo contains only runways and vacant land. The proposed project area (utilized for aircraft parking) appears to be unpaved in the 1965 - 1975 photographs, but appears paved in the 1980 through 1995 photos.

  The 1970 photograph depicts three hangars in the vicinity of the project area; the two newer hangars are located to the south of the original hangar. The 1970 photograph also shows two new structures to the north of proposed reconstruction; one of the two is in close proximity to the project. The 1985-1990 photographs depict the airport with the addition of two new buildings in the northwestern corner of the parcel, approximately 760 meters (2,500 feet) north of the project area. The 1995 photograph shows the office/hangar building (constructed in 1990, according to the assessor's field card) which is located immediately north of the project.

- City Directories

  Review of the Price and Lee City Directories did not reveal additional relevant information.

- Sanborn Fire Insurance Maps

  The Sanborn Maps were reviewed between April 28 and 30, 1997. The 1950 and 1979 maps depict only the northernmost portion of the airport property which is located approximately 610 meters (2,000 feet) north of the proposed project. The area on the maps includes the National Guard Armory, the Department of Aeronautics administration building, sheds and hangars. Five "gas tanks" were shown in the 1950 map; two appeared on the 1979 map. The tanks do not appear to be located near the project area.

- City Information

  No additional relevant information was found in city offices.

VI. SITE VISIT

Site visits were conducted by Phyllis Ertel of Storch Associates on April 7 and 30, 1997. A location map, site sketch and photographs of the project area are included in Appendix A.

The parcel, adjacent to the southern side of Maxim Road, is located in a commercial/industrial area. The property is approximately eighty (80) hectares (198 acres) in size and is bound to the north by Maxim Road, to the east by the Connecticut River, to the south by a sewage treatment facility and to the east by Lindbergh Drive. The area is flat and level.

The northern portion of the parcel contains the airport administrative office building, a National Guard Armory (with associated storage sheds, hangars and equipment), hangars, a maintenance shop, a fire station and an office building which houses various offices and aviation-related businesses. Fourteen vent pipes (typical of those for underground storage tanks - USTs) and two aboveground storage tanks (approximately 12,000 gallons in size) were observed in the northern portion of the site. The northern portion of the airport is located approximately 610 meters (2000 feet) north of the proposed ramp reconstruction project and is not included in the site sketch.

The project area is located in the central portion of the airport property and comprises a paved aircraft parking lot and heliport. The project is bound to the south by three long, narrow, corrugated metal aircraft storage hangars; to the east by a runway; to the west by Lindbergh Drive and to the north by two structures: a hangar/office building

and a maintenance hangar/office building. The pavement in the proposed project area was observed to be cracked and uneven. The area contained approximately twenty parked aircraft at the time of the site visit and was enclosed by a chain link fence. An electrical junction box was observed near the center of the aircraft parking area.

According to employees in the maintenance hangar/office and in the hangar/office buildings which are immediately north of the project, Million Air leases the two structures from the State of Connecticut, occupies a portion of the buildings and rents office space to other businesses. Three UST vent pipes, a concrete pad with UST fill caps and three aboveground storage tanks (ASTs) were observed along the northern side of the maintenance hangar/office which is located approximately 150 meters (500 feet) north of the project area. One vent pipe (typical of a heating fuel UST) was observed along the western side of the maintenance hangar; a fuel dispensing pump was noted at the southeastern corner of that building. No vent pipes were observed at the three storage hangars adjacent to the south of the reconstruction area.

Captain William Parker, Jr. from the Brainard Airport Fire Department was interviewed on April 30, 1997. He indicated that aviation fuel USTs and ASTs are located in the northwestern corner of the airport property (remote from the project area). He noted that USTs and contaminated soil were removed from the northern and central portions of the property in the late 1980s and in early 1990. Mr. Parker stated that the three storage hangars to the south of the project never contained USTs. He was not familiar with the USTs at the Million Air maintenance hangar to the north of the project, but indicated that the maintenance hangar has an oil/water separator.

Drainage appears to be to the south and west. Nine storm water drains were observed in the vicinity; two are located south-southwest of the project area. Three are found along Lindbergh Drive, north and west of the project. Three of the drains were noted in the automobile parking area which is northwest of the proposed reconstruction (and in front of the Million Air maintenance hangar). One drain was noted between the maintenance hangar and the office/hangar. Groundwater would be expected to flow to the southeast, towards the Connecticut River; however, a site assessment which was conducted in 1993 for a property in the area indicates that groundwater flow varies from southeast to southwest. The site assessment is discussed in Section VII-B-General State File Information.

VII. REGULATORY FILE REVIEW

The following sources were reviewed between April 24 and May 6, 1997 to obtain environmental information pertinent to the subject property. Information reviewed included inspection reports, permits and related applications, enforcement actions and inclusion on state and federal environmental lists.

A. Federal and State Lists

- **National Priority List (NPL)** (List Date 2/26/96)

  The NPL list identifies facilities nationwide warranting priority for remedial action under the federal Superfund program.

  This site was not listed on the NPL list.

- **Comprehensive Environmental Response, Compensation and Liability Act (CERCLIS)**

  The CERCLIS list is used to track activities at sites considered for cleanup.

  This site was not listed on the CERCLIS list.

- **Resource Conservation and Recovery Act (RCRA) Notifiers List**

  The RCRA Notifiers list is an inventory of sites which generate hazardous waste.

  CT Military Department Organizational Shop 7, associated with the National Guard facility in the northern portion of the airport, was listed with ID# CTD 983869710 as a small quantity generator with a 1988 notification date.

  Air 1 Inc., an occupant of the northern portion of the airport, was listed with ID# CTD108956616 as a large quantity generator with a 1989 notification date.

- **Resource Conservation and Recovery Act (RCRA) Treatment, Storage and Disposal Facility (TSDF) List.**

  The RCRA TSDF list is an inventory of sites which treat, store or dispose of hazardous waste generate hazardous waste.

  This site was not listed on the RCRA TSDF List.

- **State Superfund and State Superfund Priority List**

  The State Superfund List indicate sites which are eligible for expenditure of state funds for remedial actions.

  This site was not listed on the State Superfund lists.

- **List of Leaking Underground Storage Tanks (LUST)**

  The LUST List is a register of sites which have underground storage tanks that have leaked petroleum products or other chemicals to the environment.

  This site appeared on the LUST List. Information on the list indicated that ten (10) leaking tanks, utilized for jet aviation fuel, were removed from Brainard Airport in March, 1990. The tanks included four (4) 10,000 gallon and six (6) 4,000 gallon tanks. Remediation was listed as soil removal. File information indicates that the six (6) 4,000 gallon tanks were located in close proximity to the project.

  Three leaking tanks, utilized for diesel fuel, were removed from the airport in October, 1988. The tanks included one (1) 10,000 gallon and two (2) 4,000 gallon tanks. Remediation was listed as soil removal. File information indicates that the tanks were located in the northern portion of the airport.

- **Summary of Oil & Chemical Spill Incidents 1992-1997**

  This list includes all oil and chemical spills reported to CTDEP from 1992-1997 and any corrective actions taken.

  The airport property appeared on the Oil & Chemical Spill list with two (2) incidents in 1993 and one (1) in 1994. However, the spills were not significant, the status is listed as "closed" and the spill locations were remote from the proposed project.

- **National Pollution Discharge Elimination System List (NPDES)**

  This list includes all facilities which have a permit for discharge of wastewater.

  This site was listed as having five NPDES permits. Four of the permits involve the State Military Department and the Bureau of Aviation which are located along the northern boundary of the airport. The fifth permit (NPDES # GVS000505), issued to Million Air in November, 1995 and expiring in April, 2005 involves a minor discharge for general vehicle service. Million Air leases the maintenance hangar/office buildings in the southern portion of the airport.

- **Inventory of Hazardous Waste Sites in Connecticut**

  This site was not listed on the Hazardous Waste Site List.

B. General State File Information

- **Water Management Bureau** (Inspection Reports, Notices Of Violation, General Correspondence)

  No information on the subject site was located.

- **Waste Management Information** (Inspection Reports, Notices of Violation, General Correspondence)

  Information in the Air 1 Inc. RCRA file indicated that the facility was a small quantity generator. No additional information on the subject site was located.

- **Oil and Chemical Spill Reports**

  Emergency Incident Reports for spills on the airport property were found for the time period between 1974 and November, 1990. Most of the incidents were not significant and/or involved the northern portion of the property which is remote from the proposed reconstruction. The significant incidents are:

  A February, 1985 spill of 70 gallons of gasoline to the ground was cleaned, contained and removed; status is "closed".

  A June, 1985 spill of 50 gallons of aviation fuel was contained and removed; status was not indicated.

  A December, 1987 spill of 700 gallons of "Jet-A fuel" occurred at the fuel farm (northwestern corner of property) due to the overfilling of a tank truck. The spill was sanded, contained and removed; "soil removal to follow". No other information regarding that incident was found.

- **Oil and Chemical Spills Correspondence Files**

  The following information was located.

  August 30, 1988 correspondence from the CT Military Department to CTDEP, concerning a failed UST (located at the armory at the northern end of Brainard), indicated that the tank was emptied and no longer in use. A handwritten note on the letter stated that "5 of 8 tanks tested have failed."

  A May 3, 1990 letter from ConnDOT Bureau of Administration to CTDEP, concerned "1700 yards of contaminated soil stockpiled" at Brainard Airport.

A handwritten note on that letter indicated that "soil arrangements were made to go to Manchester." (This correspondence is likely related to the March, 1990 removal of leaking USTs and contaminated soil.)

A September 28, 1990 memo (with lab data and a site sketch) from Metcalf & Eddy - a consulting firm - to CTDEP discussed the removal of a "fuel distribution box & contaminated soils" from the northern end of the airport in the vicinity of the National Guard Armory. No information regarding the extent of contamination and cleanup was found.

A November, 1993 Phase II environmental site assessment report, prepared by Rizzo Associates Inc. for Airport Truck Center, was reviewed. The truck center was located on Murphy Road approximately 460 meters (1500 feet) northwest of the project area. The study found low level soil and groundwater contamination in localized area. According to the report, contaminated soil was removed from the areas; levels of contamination were below regulatory limits. Prior to 1970 this parcel was part of the Brainard Airport runway and taxiway system. Groundwater elevation data collected during the assessment indicated that a groundwater divide exists on the parcel and that groundwater flow is to the south-southwest and to the southeast (towards the project area).

- **CTDEP Property Transfer Act Filings**

No information on the subject site was located.

- **Underground Storage Facility Notification**

Underground Storage Facility Notifications were found for the various facilities contained in the northern portion of the airport property. However, a notification form relevant to the UST vent pipes and fill caps observed at the Million Air maintenance hangar in the project area was not found.

An April 5, 1990 facility notification form is relevant to the project portion of the airport. The form listed ten unlined steel USTs with "unknown" installation dates. The form noted that the four (4) 10,000 gallon tanks and six (6) 4,000 gallon tanks contained aviation fuel and were last used in 1983. A map attached to the form indicated that the tanks were designated for removal. The 10,000 gallon tanks appeared to be located towards the northern end of the airport. The 4,000 gallon tanks, however, were depicted in the vicinity of proposed reconstruction. They appear to have been located (in two groups of three) east of the present Million Air maintenance hangar/office building and north-northwest of the proposed project. (The ten tanks and contaminated soil were removed in March, 1990, according to the LUST list.)

- **Miscellaneous CTDEP File Information**

  No additional relevant information was found in CTDEP files.

C. Local File Information

- **Health Department**

  No additional relevant information on the subject site was located.

- **Building Department**

  No additional relevant information on the subject site was located.

- **Fire Marshal's Office**

  Records which were researched in the Fire Marshal's office on April 30, 1997 indicate that (with the exception of the gasoline in the aircraft) there was no fuel storage in or adjacent to the storage hangars which are located adjacent to the south of the project area. The records indicate that 40,000 gallons of gasoline were stored in underground tanks at the site of the (project area) maintenance hangar in 1971. No additional information relevant to the study area was found.

- **Planning & Zoning Department**

  No additional relevant information on the subject site was located.

D. Envirocheck Information

A supplemental CTDEP and Environmental Protection Agency (EPA) records and database search was conducted by EnviroCheck Ltd. on April 17, 1997. Their research disclosed site specific RCRA, UST, LUST and Oil & Chemical Spill information. The report also included CERCLIS, RCRA, Superfund and Transfer Act information from the area. A copy of EnviroCheck's report is appended to this report.

VIII. SUMMARY AND CONCLUSIONS

The proposed ramp reconstruction area is located in the central portion of Brainard Airport and consists of a parking lot for aircraft and a heliport. The project area has been paved for approximately seventeen (17) years, was unpaved from 1965 to 1980 and was part of the airfield and runway/taxiway system prior to 1965. A maintenance hangar and USTs are located approximately one hundred and fifty (150) meters north of the project area. File and interview information indicate that leaking USTs and contaminated soil were removed

from the northern and central (in close proximity to the project) portions of the airport property seven (7) years ago. Various fuel UST and AST areas and maintenance hangars are located in the northern portion of the airport property. File information and site observations indicate that groundwater would be expected to flow in a southerly direction with some variance from southeast to southwest. The potential exists for the release and migration from north to south of petroleum products, aircraft fluids and/or solvents from maintenance activities and/or from UST leakage.

IX. RECOMMENDATIONS

Based on this Task 120 - Preliminary Site Evaluation of the southern portion of Lot 1 in Block 3 on Tax Assessor's Map 232, 233 Maxim Road, in Hartford, Connecticut, it is the recommendation of Storch Associates that further study under the guidelines of a Task 210/220 - Surficial/Exploratory Site Investigation be conducted in the proposed reconstruction area.

X. LIMITATIONS

The activities described and the results, conclusions, and recommendations included herein are based on information gathered during a preliminary investigation of the subject site that was limited in accordance with our agreement. This investigation was further limited by the availability of information regarding potential contamination of the subject property from contiguous properties or from regional sources. A fuller investigation, which may be conducted later, may produce different or additional results. The information contained herein was prepared for your exclusive use solely in conjunction with the subject investigation. The conclusions and recommendations set forth herein are based on the conditions encountered at the subject site when the investigation was conducted. Future investigations and findings could change the contents of this report. This report was prepared in accordance with generally accepted scientific and engineering practices. No other expressed or implied warranty is made. This report is not a legal opinion.

Dear sirs:

Enclosed is the required notice of tank removal of a 10,000 gallon underground storage tank that was located on "Parcel F" at Brainard Airport. The tank was removed by Petroleum Services, Inc. of Bristol, Ct. in accordance with all applicable DEP removal guidelines. Attached is all of the pertinent information in connection with this tank removal.

Please let me know if any additional information is required.

Sincerely,

Thomas Sullivan
President

Conclusion: since trailers are empty - no violation

STATE OF CONNECTICUT
DEPARTMENT OF ENVIRONMENTAL PROTECTION

STATE OFFICE BUILDING HARTFORD, CONNECTICUT 06115

November 18, 1975

TO: Russell C. Dibble
Chief Field Inspector

FROM: Donald Burton, Jr.
Field Inspector

SUBJECT: Hartford - Reported Sheen on Connecticut River

The writer was dispatched at 1400 hours, September 15, 1975 to the dike area of Hartford in the Brainard Field area to investigate a report of an oil sheen on the Connecticut River.

Arriving at the site the writer proceeded to climb the dike and survey an area of the river at the north end of Brainard Field. No oil was evidenced on the river from this point so the writer descended the dike to the rivers edge. Seeing no oil, the writer walked along the river bank for a distance of 50 to 75 yards. Seeing no evidence of oil in this area the writer returned to his vehicle and proceeded southward along the river to a point to the rear of the sewage treatment facility, City of Hartford, where access to the river was obtained. Viewing the river from this area, the writer again saw no evidence of oil. Returning to this vehicle the writer was directed to check the river at the Route 190 Bridge in Suffield. The writer was also advised to meet David Cherico enroute.

Arriving at the Route 190 Bridge the two (2) Field Inspectors found no evidence of oil at this point. The writer was then directed to check the river again in Wethersfield.

Again, checking the river in Wethersfield, the writer found no evidence of a sheen of oil. With this completed, the writer left the site.

On September 17, 1975 at 0830 hours the writer again checked the river in Suffield, and found no evidence of oil.

Donald Burton, Jr.
Field Inspector

Management Office

Mr. G. Scott Deshefy
Program Coordinator
Connecticut Underground Storage Tank Program
Department of Environmental Protection
165 Capitol Avenue
Hartford, CT 06105

Dear Mr. Deshefy:

Enclosed is a copy of the results of a hydrostatic test performed August 2, 1988 on the diesel tank at Organizational Maintenance Shop #7 in Hartford. The tank failed the test. The tank is no longer in use and the contents have been removed.

If you need any questions regarding the enclosed test results, please contact me at 524-4937.

Sincerely,

Elizabeth F. Doran
State Environmental Specialist

Dear Mr. Porter:

Subject: Contamination, Hartford/Brainard Airport
Project No. 63-457

On April 10, 1990 I personally delivered to your office test results relative to the captioned. To date, nothing has transpired. We would appreciate your cooperation for arranging disposition of approximately 1700 yards of contaminated soil stockpiled at the airport. May we hear from you upon receipt of this letter.

Very truly yours,

William M. Hartigan

11/1/93 Phase II Environmental Site Assessment

1.0 INTRODUCTION

The subject property consists of a 4.42-acre parcel of industrial land located at 50 Murphy Road in Hartford, Connecticut (the Site) occupied by a vacant truck dealership previously operated by Airport Truck Center, Inc (Figure 1). Two buildings on the western portion of the Site provided showroom space, offices, truck repair bays, an auto body shop, and paint booth. A parts storage building is centrally located along the northern property line. Evidence of oil and hazardous materials storage and use was identified on the Site during the completion of a Phase I Site Assessment in July 1993. Based on the findings of the Phase I Site Assessment, summarized in Section 2.0, subsurface investigations were undertaken to investigate the Site soil and groundwater for evidence of oil and hazardous materials contamination. The conduct and findings of this investigation are presented in the following report and are intended to serve as an addendum to the aforementioned Phase I report.

2.0 SUMMARY OF PREVIOUS INVESTIGATIONS

An *Environmental Status Report* issued by Day Engineering of Moodus, Connecticut summarizes the conduct and findings of a review of municipal and regulatory agency files, a reconnaissance of the Site to search for evidence of potential contamination, and the installation of three groundwater monitoring wells to evaluate the quality of the Site soil and groundwater and assess groundwater flow direction. Significant findings of the subsurface investigation portion of that study are summarized below.

Three Day Engineering groundwater monitoring wells were installed on the Site. The report does not illustrate the locations of these wells, but boring logs describe the locations as "northwest, southwest, and eastern" wells. The location of these wells relative to the former on-site USTs or other potential sources of contamination could not be confirmed; however, the northwest well was presumably installed downgradient from the two former on-site USTs.

Groundwater elevation data measured in the wells indicated that groundwater on the Site flows to the west and not to the east, as indicated by regional topography. However, local topography does slope to the west, suggesting a westerly flow direction. It appears that the groundwater flow direction on the Site may be influenced by localized features, such as utility trenches or other man-made features.

Soil samples collected during the installation of the borings were analyzed for the presence of VOCs by EPA Methods 8010 and 8020. Two rounds of groundwater samples collected from the wells were also analyzed for the presence of VOCs using the aforementioned analysis methods. No detectable concentrations of target VOCs were reported in either the soil or groundwater samples.

Research and observations conducted during a *Phase I Environmental Site Assessment* completed by Rizzo Associates in July 1993, indicated that oil and hazardous materials have been stored and used on the Site since its development as a truck sales,

maintenance, and repair facility since 1970. Prior activities conducted on the Site when it was part of the Brainard Airport runway and taxiway network did not involve the use or storage of hazardous materials.

Observations made during visits to the Site indicated localized releases of petroleum to the unpaved portions of the Site. These stained soils were excavated in conjunction with UST closure activities conducted during the period of this investigation. The presence of volatile petroleum constituents were identified in the soils in two excavations resulting from the removal of the two on-site USTs. Soil excavation work conducted at the request of the DEP was undertaken to remove obviously contaminated materials. Reinspection of these excavations and a review of laboratory analysis results of soil samples collected after the completion of the soil excavation work resulted in the DEP's approval for the closure of these excavations.

3.0 PURPOSE AND SCOPE

This Phase II subsurface investigation was conducted to evaluate the Site soils and groundwater for evidence of oil and/or hazardous materials contamination. The investigation focused on areas where potential releases may have occurred, while providing general coverage of the Site. The conduct and findings of this investigation are summarized in the following report.

The scope of work for this investigation was developed based on conversations with representatives of the MDC, HRP Associates, Inc. (MDC's consultant), and Rizzo Associates during a Site meeting on September 10, 1993. Four potential sources of contamination and actions to evaluate each area were discussed. The results of these discussions are summarized below.

3.1 FUEL OIL TANK GRAVE

The fuel oil tank grave was observed during the Site visit. The excavation contained standing water that did not exhibit a noticeable sheen. Soils along the walls of the excavation appeared free of petroleum staining. HRP Associates requested confirmatory sidewall sampling for aromatic VOCs, plus MTBE (using EPA Method 8020) of a TCLP extract. In the event the samples exhibit acceptable concentrations of these constituents, no additional excavation would be required. Acceptable concentrations were generally defined as less than ten times the applicable drinking water protection criteria, as measured in the TCLP extract.

One monitoring well will be installed west of the excavation. The groundwater was sampled for aromatic VOCs and MTBE (using EPA Method 8020).

3.2 WASTE OIL TANK GRAVE

The waste oil tank grave also contained standing water. The water surface exhibited a slight sheen, and visibly stained soils were observed on the side of the excavation closest

TABLE 2
WELL CONSTRUCTION, SURVEY, AND GROUNDWATER ELEVATION DATA
Airport Truck, 50 Murphy Road, Hartford, Connecticut
September 23, 1993

Monitoring Well I.D.	Total Depth (feet)	Screen Length (feet)	Well Elevation (feet)	Depth to Groundwater (feet)[1]	Relative Groundwater Elevation[2] (feet)
RIZ-1 - PVC	14.5	10	98.55 99.06	9.69	88.86
RIZ-2 - PVC TOC	14.5	10	99.39 99.83	10.17	89.22
RIZ-3 - PVC TOC	14.5	10	99.05 99.58	10.17	88.88
RIZ-4 - PVC TOC	14.5	10	99.17 99.70	10.08	89.09
RIZ-5 - PVC TOC	14.5	10	98.39 99.04	9.62	88.77
RIZ-6 - PVC TOC	14.5	10	97.77 98.12	9.15	88.62
MW-1 - PVC TOC	14.8	Unknown	98.37 98.91	10.27	88.64

1 Depth to groundwater measured from top of PVC, except at MW-1 where it was measured from top of road box casing (TOC).
2 Elevations relative to an arbitrary benchmark of 100.00 feet established at the center of the fifth garage bay on the north side of the on-site building.

Results from the second round of sampling from the east wall of the waste oil UST grave (WOTE2) indicate that the 61 mg/L of TPH in the soils remaining in the pit are below the remediation goal of 100 mg/L. No lead was detected in this sample during the TCLP analysis. Laboratory results and chain-of-custody forms for all soil samples are included in Appendix D.

4.5 CONSTRUCTION OF POTENTIOMETRIC SURFACE MAP

Groundwater flow direction at the Site was determined by constructing a potentiometric surface map using groundwater elevation data measured from the newly installed monitoring wells. The elevations of the monitoring wells were surveyed by Rizzo Associates personnel on September 23, 1993. The elevations were established relative to an arbitrary benchmark of 100.00 feet established at the garage bay floor on the north, central portion of the garage building. The depth to groundwater in each well was measured relative to the rim of the protective curb box secured over each well prior to groundwater sample collection. Depth to groundwater measured in each of the wells was subtracted from the relative elevations of the well road boxes to yield relative groundwater elevations for each well location. The survey data used to calculate the relative groundwater elevations is summarized on Table 2.

The survey data was used to construct the groundwater elevation contours shown on Figure 2. The potentiometric surface contours indicate that a groundwater divide is

located near the on-site buildings. Groundwater on the eastern side of the divide flows to the southeast, while groundwater on the western side of the divide flows toward the southwest. Groundwater on the south end of the Site, near the showroom building, is expected to flow south.

4.6 *FIELD MEASUREMENTS AND LABORATORY ANALYSIS RESULTS OF GROUNDWATER SAMPLES*

Groundwater samples from each of the wells and the production well were screened in the field to measure pH, temperature, and specific conductance. The results of the field screening measurements are recorded on Table 3. The pH, temperature, and specific conductance values recorded during sample collection were within the normal ranges typically observed by Rizzo Associates for natural New England groundwater.

Laboratory results on groundwater samples collected from each of the newly installed monitoring wells on September 28 and October 21, 1993 are summarized in Table 3. The laboratory Certificates of Analysis and chain-of-custody records for these samples are included in Appendix D.

Detectable concentrations of VOCs were reported in the groundwater sample collected from well RIZ-3. Two chlorinated solvents, 1,1-DCA and 1,2-DCE, were detected during the first round of sampling in RIZ-3 at concentrations of 5.8 and 12 µg/L, respectively.

No VOCs were detected in the other on-site monitoring wells during the first round of sampling. These compounds are common degreasing agents used in the automobile repair industry.

The second round sampling analyses indicated similar results, with 1,1-DCA and 1,2-DCE detected in RIZ-3 at concentrations of 4.1 and 9.1 µg/L, respectively. The MCL for 1,2-DCE is 70 µg/L. No MCL has been set for 1,1-DCA. MTBE was detected during this round of sampling in well RIZ-4 at a concentration of 13 µg/L. No MCL has been set for MTBE.

Soluble barium, selenium, and arsenic were the only RCRA heavy metals detected in the groundwater collected from the Site. Barium was detected at low concentrations in all six on-site monitoring wells. The concentration of barium is very similar in all six wells, between 0.07 and 0.14 mg/L, and is expected to be a naturally occurring metal in the area groundwater. Well RIZ-5 also contained dissolved arsenic at a concentration of 0.008 mg/L. Well RIZ-1 contained selenium at a concentration of 0.01 mg/L. The MCL for arsenic is 0.05 mg/L, for barium is 1.0 mg/L, and for selenium is 0.01 mg/L. Results for RCRA 8 metals analyses indicate that all results are below the MCL except selenium in RIZ-1, which is at the MCL.

Petroleum hydrocarbons were not detected in the six newly installed on-site monitoring wells.

5.0 DISCUSSION OF SUBSURFACE INVESTIGATION FINDINGS

The findings presented in the preceding portions of this report described the methods, techniques, and analytical results of the investigation activities conducted during this study. The following discussion is intended to provide an overview of the investigation findings.

The lack of contamination detected in the soils collected during boring advancement and in the groundwater indicates that the soil contamination identified in the fuel oil and waste oil UST graves was localized. Contaminated soils in these two areas have been remediated to the furthest extent possible in order to meet the remediation goals of 100 mg/kg for TPH and ten times the applicable MCLs, as measured in the TCLP extract.

6.0 SUMMARY AND RECOMMENDATIONS

Rizzo Associates conducted subsurface investigations on the Site to evaluate the soil and groundwater for evidence of contamination. Potential contamination sources, including USTs, floor drains, and sumps, were targeted in this investigation. Significant findings of the investigation are summarized below.

- Soils located near the waste oil aboveground storage tank were found to contain TPH and soluble lead typically associated with waste petroleum generated by a truck repair business. Additional soil was excavated, and the remaining soils were found to contain acceptable levels of TPH and no detectable concentrations of soluble lead.

- Groundwater near the oil/water separator in the former repair building was found to contain low levels of two chlorinated solvents that are typically associated with engine repair facilities. Where MCLs have been set by the EPA, laboratory results have consistently been below these levels. Laboratory analysis data of groundwater samples collected from this area did not indicate that this contamination has significantly impacted the groundwater on the Site.

Based on these findings, Rizzo Associates makes the following recommendations.

- The remaining 40 to 50 cubic yards of stockpiled waste oil contaminated soil at the Site should be transported to a licensed disposal/recycling facility.

7.0 LIMITATIONS

This report is subject to the limitations outlined in Appendix A. This study and report have been prepared on behalf of and for the exclusive use of Airport Truck Center, Inc. solely for use in an environmental evaluation of the Site. This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other

Above is the list of databases that were searched. The number in the box shows the number of documents found for the site which are described in the following pages, with supporting documents attached. If there were no matches found, there are no additional reports.

SEARCH INFORMATION

Provided Site Address(es):

1. 233 MAXIM ROAD, HARTFORD, CT
2. 20 LINDBERGH DRIVE, HARTFORD, CT
3. 50 MURPHY ROAD, HARTFORD, CT

Provided Site Name:

1. BRAINARD FIELD
2. AIRPORT

Discovered Site Name:

1. AIR ONE
2. BRAINARD AIRPORT HEADQUARTERS
3. NATIONAL GUARD
4. AIRPORT TRUCK CENTER

RCRA NOTIFIER

The following site specific information was revealed.

Name: AIR 1 INC
Address: BRAINARD ARPT, HARTFORD, CT
USEPA Identification Number: CTD108956616
Activity and Notification Date: VG 7-Nov-89

Same as Millionaire 20 Lindbergh Drive? ✓

ABOUT THIS DATABASE...

RCRA Notifiers in Connecticut, USEPA database. This USEPA database records sites registered with the USEPA as generators of hazardous waste. The record includes the generator status determined by the quantity of waste produced. Only those sites in compliance with federal waste handling notification practices are included on the list.

FINDS

The following site specific information was revealed.

Name: AIR 1 INC
Address: BRAINARD ARPT, HARTFORD, CT
EPA Identification Number: CTD108956616
Monitoring Offices: RCRA

ABOUT THIS DATABASE...

Facility Index System, USEPA database. FINDS indexes all sites that have been assigned an USEPA identification number, and lists the programs that monitor the facility. This database of databases describes the USEPA programs which regulate a specific facility.

CTDEP UNDERGROUND STORAGE TANK

The following site specific information was revealed. Copies of the tank registration forms and related site maps or correspondence are attached to this EnviroCheck report.

Registration Number: #8620
Site Name: BRAINARD AIRPORT HEADQUARTERS
Site Address: MAXIM ROAD, HARTFORD, CT

Registration Number: #9013
Site Name: NATIONAL GUARD ARMORY
Site Address: MAXIM ROAD, HARTFORD, CT

Registration Number: #9978
Site Name: HARTFORD - BRAINARD AIRPORT
Site Address: 233 MAXIM ROAD, HARTFORD, CT

Registration Number: #4470
Site Name: AIRPORT TRUCK CENTER
Site Address: 50 MURPHY ROAD, HARTFORD, CT

ABOUT THIS DATABASE...

Underground Storage Facility Notification forms, CTDEP Underground Storage Tank Enforcement Program, Bureau of Waste Management file documents. These forms document the presence of underground storage tanks and include information on the number of tanks, their size, contents, date of installation, and construction at registered sites.

SUBJECT: Life Expectancy of Underground Storage Tanks

Pursuant to subsection (h) of the DEP's regulations on Underground Storage Tanks, life expectancy is as follows:

FIBERGLASS REINFORCED PLASTIC - manufacturers' corrosion warranty period.

CATHODICALLY PROTECTED EXTERNALLY COATED STEEL - same as above or calculated anode life.

*** Existing facilities not either of the above - 15 years from date of installation.

On your notification form you failed to indicate the life expectancy for the tank(s) listed below, therefore, we are assuming your life expectancy(s) to be 15 years. If you have documentation that indicates otherwise, please contact us at 566-4630.

Sincerely yours,

Eleanor A. Tewksbury

	Top of	
	water	-0
	Transfer total to line 25a	

18. SPECIAL CONDITIONS AND PROCEDURES TO TEST THIS TANK

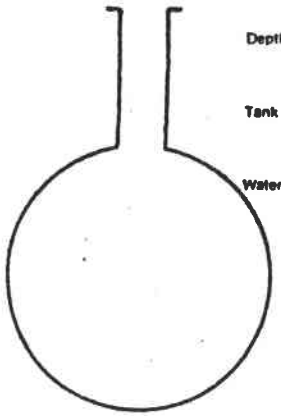
☐ Water in tank ☐ Line(s) being tested with LVLLT ☐ High water table in tank excavation

See manual sections applicable. Check below and record procedure in log (27).

Use maximum allowable test pressure for all tests.
Four pound rule does not apply to doublewalled tanks.

Complete section below:

1. Is four pound rule required? Yes ☒ No ☐
2. Height to 12" mark from bottom of tank 129 in.
3. Pressure at bottom of tank 4 P.S.I.
4. Pressure at top of tank 1.7 P.S.I.



Depth of burial 90 in.
Tank dia. 72 in.
Water table — in.

NOTES:

The above calculations are to be used for dry soil conditions to establish a positive pressure advantage, or when using the four pound rule to compensate for the presence of subsurface water in the tank area.

Refer to N.F.P.A. 30, Sections 2-3.2.4 and 2-7.2 and the tank manufacturer regarding allowable system test pressures.

19. TANK MEASUREMENTS FOR TSTT ASSEMBLY

Bottom of tank to grade* 90 in.
Add 30" for "T" probe assy. 30 in.
Total tubing to assemble — approximate 120 in.

20. EXTENSION HOSE SETTING

Tank top to grade* 18 in.
Extend hose on suction tube 6" or more below tank top 24 in.

*If Fill pipe extends above grade, use top of fill.

Date: April 13, 1989

Telephone: 566-4630

Subject: Brainard Airport

I have enclosed a copy of the Underground Storage Tank Notification information that we currently have on file for Brainard Airport. Note that there are a total of seven (7) USTs registered by three (3) separate facility owners. We do not know if there are any unregistered USTs at the airport. This notification information indicates that Tanks D-1 and W-1 at the Airport Headquarters will be due for removal (or permanent closure) by September 1, 1989. Tank R-1 at the Airport Headquarters is required to have a hydrostatic failure determination test in 1989, and annually thereafter through 1997 when permanent closure will be required. Tank 2 at the Organizational Maintenance Shop No. 7 (installed 6/74) was due for a hydrostatic failure determination testing by November 1, 1988, and is required to be tested annually through 1994, and then permanently closed. Tank 1-X, owned by Charter Oak Aviation, was supposedly tested during August, 1988. We do not have these results in our files, but we will request them. Tank 1-X must be annually tested through the year 1993, and then permanently closed.

Please feel free to contact me if you need any additional information concerning Brainard Airport. I have enclosed a copy of Section 22a-449(d)-1 of the Regulations of Connecticut State Agencies for your information.

SUBJECT: Life Expectancy of Underground Storage Tanks

Pursuant to subsection (h) of the DEP's regulations on Underground Storage Tanks, life expectancy is as follows:

FIBERGLASS REINFORCED PLASTIC - manufacturers' corrosion warranty period.

CATHODICALLY PROTECTED EXTERNALLY COATED STEEL - same as above or calculated anode life.

(X) Existing facilities not either of the above - 15 years from date of installation.

On your notification form you failed to indicate the life expectancy for the tank(s) listed below, therefore, we are assuming your life expectancy(s) to be 15 years. If you have documentation that indicates otherwise, please contact us at 566-4630.

Tank A-1

Sincerely yours,

Joseph Cotter

ABOUT THIS DATABASE...

List of Leaking Underground Storage Tanks, CTDEP Underground Storage Tank Enforcement Program, Bureau of Waste Management database. This list compiles information on leaking underground storage tanks based on Inspection reports filed by the Oil and Chemical Spill Section. This data base includes only those leaking tanks reported to the CTDEP.

CTDEP OIL AND CHEMICAL SPILL REPORTS

ABOUT THIS DATABASE...

Oil and Chemical Spill Reports, CTDEP Oil and Chemical Spill Response Division, Bureau of Waste Management file documents. This database contains records of the 60,000 spills and discharges reported to the CTDEP Oil and Chemical Spill Section. These incidents may result in an inspection by this section, referral to another bureau, or may warrant no response. The reports may describe follow-up inspections and clean up activities.

November 18, 1975

TO: Russell C. Dibble
Chief Field Inspector

FROM: Donald Burton, Jr.
Field Inspector

SUBJECT: Hartford - Reported Sheen on Connecticut River

The writer was dispatched at 1400 hours, September 15, 1975 to the dike area of Hartford in the Brainard Field area to investigate a report of an oil sheen on the Connecticut River.

Arriving at the site the writer proceeded to climb the dike and survey an area of the river at the north end of Brainard Field. No oil was evidenced on the river from this point so the writer descended the dike to the rivers edge. Seeing no oil, the writer walked along the river bank for a distance of 50 to 75 yards. Seeing no evidence of oil in this area the writer returned to his vehicle and proceeded southward along the river to a point to the rear of the sewage treatment facility, City of Hartford, where access to the river was obtained. Viewing the river from this area, the writer again saw no evidence of oil. Returning to this vehicle the writer was directed to check the river at the Route 190 Bridge in Suffield. The writer was also advised to meet David Cherico enroute.

Arriving at the Route 190 Bridge the two (2) Field Inspectors found no evidence of oil at this point. The writer was then directed to check the river again in Wethersfield.

Again, checking the river in Wethersfield, the writer found no evidence of a sheen of oil. With this completed, the writer left the site.

On September 17, 1975 at 0830 hours the writer again checked the river in Suffield, and found no evidence of oil.

Donald Burton, Jr.
Field Inspector

CTDEP TRANSFER ACT FORMS

The following site specific information was revealed. Copies of these documents are attached to this EnviroCheck report.

Site Address: 50 MURPHY ROAD, HARTFORD, CT
Owner: AIRPORT TRUCK CENTER, INC.
Operator: AIRPORT TRUCK CENTER, INC.
Doing Business As:
Property Owner: AIRPORT TRUCK CENTER, INC.
Transferor: AIRPORT TRUCK CENTER, INC.
Transferee: THE METROPOLITAN DISTRICT
Date of Transfer: 11/19/93
Type of Form Filed: III

ABOUT THIS DATABASE...

Forms I through IV, CTDEP Transfer Program, Site Remediation and Closure Division, Bureau of Waste Management file documents from CTDEP Transfer Act Program. Transfer Bill Forms I through IV are filed as a result of the transfer of a property with a listed land use or a record of generating a regulated quantity of hazardous waste (an establishment). A Form I declares that no discharge of hazardous waste has occurred on the site, while Forms II and III state that a release has occurred and either has been or will be mitigated. A Form IV states that a release has occurred, remediation has been completed and monitoring may continue. Only those establishments in compliance with the Transfer Bill have forms on file.

Revised 2/90

RECEIVED
DEC 06 1993
WATER MANAGEMENT
PERMITTING, ENFORCEMENT
& REMEDIATION DIVISION

CERTIFICATION

Submitted Pursuant to Connecticut General Statutes Sections 22a-134 to 22a-134 (d), inclusive.

FORM III

(Complete all sections of Form III when a release has occurred which has not been cleaned up in a manner approved by the Commissioner of Environmental Protection or for any other reason a negative declaration cannot be submitted). Form III must be submitted prior to the transfer.

SECTION A. GENERAL ESTABLISHMENT INFORMATION

1. OWNER OF ESTABLISHMENT

a. Name (if corporation, the full exact name as registered with the Connecticut Secretary of State):

Airport Truck Center, Inc.

b. Mailing Address: Street: 251 Wickham Road

Town: Glastonbury State CT Zip 06033

c. Authorized Contact: Name: Alfred E. Paulekas

Title: President

Phone No.: (203) 633-7838

d. EPA (RCRA) ID No.: CTD _ _ _ _ _ _ _ _ _

e. Type of transfer: Transfer of ownership (conveyance of real estate)

2. OPERATOR OF ESTABLISHMENT

a. Name (Give name or company which exists/existed on-site. If a corporation, the full exact name as registered with the Connecticut Secretary of State):

Airport Truck Center, Inc.

b. Mailing Address: Street: 251 Wickham Road

Town: Glastonbury State CT Zip 06033

c. Authorized Contact: Name: Alfred E. Paulekas

Title: President

Phone No.: (203) 633-7838

RECEIVED
JAN 18 1994
WATER MANAGEMENT
PERMITTING, ENFORCEMENT
& REMEDIATION DIVISION

3. PROPERTY OWNER

a. Name: Airport Truck Center, Inc.
(as appears in land records)

b. Mailing address: Street: 251 Wickham Road

Town: Glastonbury State CT Zip 06033

c. Authorized Contact: Name: Alfred E. Paulekas

Title: President

Phone No.: (203) 633-7838

d. Map: Include a map of the property location.

DESCRIPTION IN PROPERTY DEED: Recorded on page 1234 of volume 100, of the town of Hartford land records, as lot 018, block 001 on map 233 in the town of Hartford, Tax Assessor's Office.

SECTION B. Indicate the reason why the transferor is unable to submit a negative declaration:

Tank and soil removal as referenced in that certain report entitled, "Report on Environmental Activities at 50 Murphy Road, Hartford, Connecticut...ERI Project No. 1020-93 July 1993" (copy attached) and "Phase II Environmental Site Assessment, Airport Truck Center, Inc., 50 Murphy Road, Hartford, Connecticut, November 1, 1993" (copy attached).

SECTION C: CERTIFICATION

An establishment located at 50 Murphy Road (street) Hartford (town) is being transferred on 11/19/93 (Date) by Airport Truck Center, Inc. (Transferor) to The Metropolitan District (Transferee).

The transferor is unable to submit a negative declaration to the transferee under 22a-134(a) of the Connecticut General Statutes.

As a party to the transfer, I certify that, to the extent necessary to minimize or mitigate a threat to human health or the environment, I shall contain, remove, or otherwise mitigate the effects of any discharge, spillage, uncontrolled loss, seepage, or filtration of hazardous waste at the site of said establishment in accordance with procedures and a time schedule approved

Dear Applicant:

This letter is to confirm the receipt of the following application package:

Permit Type: GENERAL PERMITS

STORMWATER INDUSTRIAL - (BRAINARD AIRPORT)

Your application has been assigned the following application number: **199800658**
Please include this number on all correspondence regarding this application.

As of today, the following materials have been received:

ITEM	REQUIRED FEE	FEE RECEIVED	RECEIVED ON
Application Package			**JANUARY 6, 1998**
Application Fee:	$ .00	$ .00	

The fee for this application has been discounted 100%.

If there are any questions regarding this notice, please feel free to contact the Central Permit Processing Unit at (860)424-4004.

Your application has been forwarded to the appropriate permit program. As a reminder, depending on the type of permit you are seeking, you may be required to publish notice of your application in accordance with Section 22a-6g of the General Statutes and submit a copy of such notice to DEP. If this is the case, DEP will not process your application further until we have received the certified copy of such notice.

If you have specific technical questions regarding your application, please contact the permit program directly:

WATER MANAGEMENT BUREAU/PERMITS, ENFORCEMENT & REMEDIATION DIVISION, (860) 424-3018

Please be aware that any work without the permits or authorizations required by

Section 22a-430b CGS

is a violation of state law, and may subject you to enforcement action. Also, the application review process is a continuing one. The department may request further information to evaluate your application.

Thank You.

Sincerely,

Central Permit Processing Unit

- ☐ A *replacement* of an individual NPDES permit
- ☒ A *renewal* of an existing general permit
- ☐ A *modification* of an existing general permit

Please identify any previous or existing permit number in the space provided:

GSW001457

Part II: Fee Information

A fee of $250.00 is to be submitted with *each* registration that you are submitting. For municipalities, there is no fee. The registration will not be processed without the fee.

Part III: Registrant Information

1. Fill in the name of the registrant(s) as indicated on the *Permit Application Transmittal Form* (DEP-APP-001):

Registrant: State of Connecticut Department of Transportation

Phone: (860) 292-2006 ext: _____ Fax: (860) 627-3594

☐ Enter a check mark if there are co-registrants. If so, label and attach additional sheet(s) with the required information as supplied above.

Facility Name: Brainard Airport

General Permit Registration Form for the Discharge of Stormwater Associated with Industrial Activity

Please complete this form in accordance with the general permit (DEP-PERD-GP-014) in order to ensure the proper handling of your registration. Print or type unless otherwise noted. You must submit the *Permit Application Transmittal Form* (DEP-APP-001) and the registration fee along with this form.

DEP USE ONLY
Application No.
Permit No.
Facility I.D.

Part I: Registration Type

Enter a check mark in the appropriate box identifying the registration type.

This registration is for (check one):

- ☐ A *new* general permit registration
- ☒ A *replacement* of an individual NPDES permit
- ☐ A *renewal* of an existing general permit
- ☐ A *modification* of an existing general permit

Please identify any previous or existing permit number in the space provided:

GSW001457

Part II: Fee Information

A fee of $250.00 is to be submitted with *each* registration that you are submitting. For municipalities, there is no fee. The registration will not be processed without the fee.

Part III: Registrant Information

1. Fill in the name of the registrant(s) as indicated on the *Permit Application Transmittal Form* (DEP-APP-001):

Registrant: State of Connecticut Department of Transportation

Phone: (860) 292-2006 ext: _____ Fax: (860) 627-3594

☐ Enter a check mark if there are co-registrants. If so, label and attach additional sheet(s) with the required information as supplied above.

Facility Name: Brainard Airport

Part V: Stormwater Discharge Information

1. Number, type, material and size of conveyances, outfalls, or channelized flows that run off the site (e.g. 15" concrete pipe): 15" corrugated metal pipe (A), 15" reinforced concrete pipe (B), 21" corrugated metal pipe (C), unknown diameter corrugated metal pipe (D)

2. Where does stormwater discharge to:

   - Municipal Separate Storm System? ☒ Yes ☐ No Name: MDC
   - Surface water body or wetlands? ☒ Yes ☐ No Name: Connecticut River
   - Is discharge located less than 500 feet from a tidal wetland which is not a fresh-tidal wetland?

     ☐ Yes ☐ No (only for discharges initiated after October 1, 1997)

3. Name of the watershed where the site is located *OR* nearest waterbody to which it discharges:
   Connecticut River

4. Volume of one inch of rainfall runoff from the site for a 24-hr., 25 year storm, if available:
   Not Available

Part VI: Supporting Documents

☒ Please enter a check mark here as verification that an 8½" X 11" copy of the relevant portion of a USGS Quadrangle Map indicating the exact location of the facility has been submitted with this registration. Indicate the quadrangle name on the map, and be sure to include the registrant's name as indicated on the *Permit Application Transmittal Form*. (To obtain a copy of the relevant USGS Quadrangle Map, call your town hall or DEP Maps and Publications Sales at 860-424-3555.)

BRAINARD GENERAL AVIATION AIRPORT
STORM WATER POLLUTION PREVENTION PLAN
CERTIFICATION

Professional Engineer Certification

I certify that, in my professional judgment, the storm water pollution prevention plan prepared for this site meets the criteria set forth in the general permit for the discharge of storm water from industrial activities issued on October 1, 1992 (as modified October 1, 1995) with the exceptions noted below. This certification is based on my review of the storm water pollution control plan for the site and an inspection of the site. I am aware that there are significant penalties for false statements in this certification, including the possibility of fine and imprisonment for knowingly making false statements. Known exceptions to the general permit criteria are: the non-storm water requirements of the general permit are not fully met at this site, as described in this SWPPP. The non-storm water certification is modified accordingly.

Subject: Assignment No. 94299
General Aviation Airports
Brainard SWPPP Certification

Dear Mr. Daly:

Metcalf & Eddy encloses three copies of the Storm Water Pollution Prevention Plan (SWPPP) for Brainard Airport. We revised these SWPPPs to reflect:

- conditions at the airport as of November 17, 1995
- conditions set forth in CTDEP's modified *General Permit for the Discharge of Stormwater Associated With Industrial Activity*, effective October 1, 1995
- plan and non-storm water discharge certifications by a professional engineer licensed in Connecticut.

Please note, M&E modified the certifications due to the fact that the non-storm water requirements of the general permit are not fully met at this site.

Because we modified the certifications, CTDOT must re-sign one of the certifications (see certification found behind letter of transmittal). Also, an addendum to the non-storm water certification (page 23) needs to be completed by CTDOT. After completing this pages, please send us copies so we may have them for our project files

BRAINARD GENERAL AVIATION AIRPORT
STORM WATER POLLUTION PREVENTION PLAN

INTRODUCTION

In accordance with the Federal Clean Water Act (CWA) and the State of Connecticut General Statutes Section 22a-430, any person or municipality who initiates, creates, originates, or maintains any discharge to the waters of the state shall obtain a permit for that discharge from the Commissioner of Environmental Protection. Traditionally, these permits have focused on sewage treatment and industrial process wastewater discharges. However, the CWA was revised in 1987 by adding Section 402(f) to address storm water discharges, and current federal regulations (40 CFR Parts 122, 123, and 124) now require discharge permits for a variety of storm water discharges associated with industrial activity. On October 1, 1992, the State of Connecticut Department of Environmental Protection issued a "General Permit for the Discharge of Storm Water Associated with Industrial Activity" as a mechanism for qualified applicants to secure the necessary permit coverage for their storm water discharge(s). A copy of this general permit (modified October 1, 1995) is located in Appendix I.

In compliance with the Connecticut Department of Environmental Protection *General Permit for the Discharge of Storm Water Associated with Industrial Activity*, a Storm Water Pollution Prevention Plan (SWPPP) must be maintained at facilities covered by the permit. The SWPPP presented in this document was originally developed for the Connecticut Department of Transportation, Bureau of Aviation and Ports, Brainard General Aviation Airport in April 1993. It has been revised based on observations during a site visit in November 1995.

A copy of the completed storm water general permit registration for Brainard General Aviation Airport is provided in Appendix II. The registration is the first part of the storm water general permit for this airport and it was submitted to the DEP on November 30, 1993.

This SWPPP has been prepared in accordance with the General Permit and is broken into sections covering the following topics:

- Initial Site Assessment
- Potential Pollution Sources
- Non-Storm Water Discharges
- Storm Water Pollution Prevention Team
- Employee Training
- Spill Prevention and Response
- Best Management Practices
- Semi-Annual Inspections
- Annual Monitoring
- SWPPP Review and Modification
- Plan Implementation Schedule

Each of these sections includes a brief description of general information providing an overview of the topic as well as tables, checklists, and other aids designed to summarize the specific topic, simplify the presentation of information, and ease the process of updating the plan. When using or updating the SWPPP, all of the sections should be reviewed as specific information contained under one section may not be included in other sections of the plan.

This plan is not intended to control operations but to provide guidelines for mitigating the release of pollutants to storm water. Therefore, the plan should be reviewed, at least annually, to evaluate its accuracy and effectiveness and modified when operations and facilities change or it is shown to be ineffective. More specifically, it is the responsibility of the permittee (ConnDOT) to "... amend the plan whenever (1) there is a change at the site which has an effect on the potential to cause pollution of the waters of the state; or (2) the actions required by the Plan fail to ensure or adequately protect against pollution of the waters of the state. The permittee shall amend the plan as necessary to address any sources or potential sources of pollution identified as a result of a comprehensive site compliance evaluation..." (General Permit).

Amendments to the plan and actions required by the plan must be completed within 60 days of the date on which ConnDOT becomes aware or should become aware that either of the conditions stated above has occurred. The Storm Water Pollution Prevention Team Leader, identified as the airport fire captain for Brainard Airport, shall be responsible for reviewing the effectiveness of the plan and updating it as required. However, all team members share in the responsibility of notifying the team leader of circumstances or changes which affect this plan.

BRAINARD GENERAL AVIATION AIRPORT

INITIAL SITE ASSESSMENT

BRAINARD GENERAL AVIATION AIRPORT
SITE ASSESSMENT

General Information

An initial site assessment was conducted as part of the preparation of this *General Permit for the Discharge of Storm Water Associated with Industrial Activity* SWPPP. The objective of the initial site assessment was to identify the materials and practices at the site that may contribute to storm water pollution problems.

Potential contaminant sources which must be identified in the SWPPP include the following: stored materials which are exposed to precipitation; spills or leaks greater than 5-gallons; vehicle fueling operations; vehicle and equipment maintenance and/or cleaning activities; material loading and unloading; waste treatment, storage, or disposal; processing operations; tank storage; and site activities that could cause soil erosion.

The initial SWPPP site assessment for Brainard Airport was conducted by Metcalf & Eddy, Inc. on March 3, 1993. A supplemental site assessment was made during a site visit on April 15, 1993. The site assessments involved a meeting with SWPPP team members, a walk-through of existing buildings, and a windshield assessment and visual observation of the general airport conditions and operations. Information regarding material inventory and significant spills and leaks was provided by the team members.

A follow-up site visit was made on November 17, 1995. This SWPPP has been revised and reflects the observations made on November 17, 1995. The following site assessment provides a summary of Brainard Airport, beginning with an overview of the airport property. The enclosed site plan (Figure 1) should be used for reference as most of the facilities discussed below are identified on the plan.

The site plan (Figure 1) included in this SWPPP is based on plans and information provided by ConnDOT. Field review of the plans by Metcalf & Eddy supplemented the information provided by ConnDOT.

The site plan shows the major features at the airport including: buildings, runways, taxiways, and storm drainage. Also, materials which are known to be stored outdoors and current tenants are identified.

The information used to prepare the site plan only provided limited topography for the airport. Therefore, no topographic contours are shown on the site plan. However, drainage areas contributing to the storm water point discharges are shown. These drainage areas are based on information from other plans and M&E field observations.

Overview

Brainard Airport was opened in 1921 and is located on a 200 acre site approximately two miles southeast of downtown Hartford. The airport has two operating runways (2-20 and 11-29), as well as several taxiways, hangars, maintenance buildings, charter facilities, and a Connecticut Army National Guard complex.

There are four storm water point discharges from Brainard Airport. These point discharges and associated drainage areas are identified on the site plan (Figure 1) as "Discharge A," "Discharge B, "Discharge C," and "Discharge D." Below is a brief description of each point discharge and the associated drainage area. Additional details for these discharges are given in Table 1.

Discharge A receives runoff from the major portions of the airport runways. Discharges are released through a 15-inch pipe to the Connecticut River. The primary features and activities located within the drainage area of Discharge A include: the northern portion of runway 2-20, associated taxiways and grassed infield areas, and the hangar areas west of runway 2-20, including the Million Air, Inc. hangars.

Discharge B also consists of a 15-inch pipe that discharges directly to the Connecticut River. The drainage area for this discharge includes: the southern section of Runway 2-20, most of Runway 11-29, and associated taxiways and infield areas. No airport building areas were observed to drain through this discharge.

Discharge C is connected to the Metropolitan District Commission (MDC) storm sewer system at the south-western end of the airport. The drainage area for this discharge collects runoff from the western end of Runway 11-29, associated airport taxiways and infield areas, and various airport buildings, including the T-hangars and control tower.

Discharge D is connected to the MDC sewage system at the northwestern end of the airport. The drainage area for this discharge includes ConnDOT office buildings, the Connecticut Army National Guard Facility, and other nearby office areas.

There are five primary tenants at the Brainard General Aviation Airport, including the Connecticut Department of Transportation (ConnDOT), Million Air, Inc., CT Air Group, Shoreline Aircraft Maintenance, Inc., and the Army National Guard. Due to the varying nature of tenant operations, building locations, and general responsibilities, the following site assessment is divided by tenant. For each tenant, brief descriptions of their operations/responsibilities, facilities, and equipment and material usage are provided. At the end

TABLE 1. DISCHARGE SUMMARY FOR BRAINARD GENERAL AVIATION AIRPORT (APRIL, 1993)

Discharge Code	Drainage Area	Type of Conveyance	Size	Material	Receiving Water or Drainage System	Comments
A	51-AC	Pipe	15"	Corrugated Metal	Connecticut River	
B	123-AC	Pipe	15"	Reinforced Concrete	Connecticut River	Discharge flows through a 10' wide canal entering the Connecticut River through a submerged pipe
C	79-AC	Pipe	21"	Corrugated Metal	M.D.C. Property Storm Drainage System	Discharge is connected to the parking lot drainage system at an MDC property
D	36-AC	Pipe	Unknown	Corrugated Metal	M.D.C. Storm Drainage System	Connected to storm drainage system located in Maxim Road

of each section, there is also an assessment of the tenants' facilities and operations as they relate to the SWPPP. It is emphasized that the information gathered during the site assessments was not intended to be comprehensive but was strictly limited to information required to develop the SWPPP. However, prior to assessing each tenant assessment, a few general issues which pertain to several of the tenants are discussed.

Material Loading/Unloading. In general, most significant materials are transported to the airport tenants in 55-gallon drums by delivery trucks. The materials are typically unloaded outside the tenant facilities and subsequently stored inside the hangars. On-site drummed materials are generally moved with hand trucks.

Product is delivered to the aviation, gasoline, and diesel fuel storage tanks by tanker trucks. Fuel is transferred to vehicles or equipment through dispensers located near the underground fuel storage tanks. Finally, aircraft fuel is removed from the underground tanks and delivered to aircraft by on-site tanker trucks.

Wastes. No known hazardous wastes were identified at Brainard Airport. However, non-hazardous Connecticut regulated waste CR02 (waste oil) is a common waste and is discussed in the individual tenant assessments.

Exterior Manufacturing/Process Areas. No exterior process areas exist at the airport.

Vehicle/Equipment Maintenance and Washing. Maintenance and washing of vehicles and equipment are discussed in the tenant assessments which follow.

Pesticides/Fertilizers. No pesticides, fertilizers, or herbicides are knowingly used at the airport.

Erosion. There were no erosion problems observed at the airport during the site assessment.

Dust/Particulate Generating Processes. No dust or particulate generating activities were identified at the airport.

ConnDOT

Operation/Responsibilities. The Connecticut Department of Transportation owns and is responsible for the general management of the airport. They provide general maintenance of the airport, including mowing grass, snow plowing, and maintenance of mechanical and physical properties such as the runways and navigational aids. ConnDOT also provides fire emergency response services for the airport.

Facilities. There are two ConnDOT facilities of concern at Brainard Airport: the fire facility and the DOT maintenance garage. All other ConnDOT facilities on site only contain offices. The fire facility is located at the far northern end of the airport and contains administration offices and an attached vehicle garage. The fire equipment is kept inside the garage most of the time. The ConnDOT maintenance garage is also located at the far northern end of the airport. This facility consists of office space and a vehicle garage. In addition, ConnDOT operates a sand storage shed located at the north end of Runway 2-20.

Materials and Equipment. Equipment kept and maintained by DOT at Brainard Airport includes a fire fighting truck and various dump trucks, snow plows, and front end loaders. This equipment is used in the regular maintenance of runways, primarily during the winter months.

Based on site visit observations and information provided by airport officials, materials typically handled and stored by ConnDOT include motor fuel, heating oil, waste oil, cleaning solvents, ethylene glycol, and fire fighting foam. A complete list of materials used on site is kept in Material Safety Data Sheet (MSDS) records which are located in the fire facility. Motor fuel is stored in two 4,000-gallon underground storage tanks located outside the ConnDOT maintenance facility. One tank contains low lead gasoline and the other contains diesel fuel. A fuel dispensing island is also located in this area. Waste oil, mineral spirits, and paint are located inside the maintenance garage in closed 55-gallon drums.

Sand is stored and used by ConnDOT during the winter months. The sand is located near the Army National Guard facility and is stored in an enclosed building that is typically opened during sand deliveries and winter use. Sand is used on the runways and taxiways should snow and ice accumulate on these surfaces.

Assessment. All materials, with the exception of the motor fuels, are stored within the maintenance garage or fire fighting facility. Two floor drains exist in the firefighting facility and one in the maintenance garage. These large floor drains with sumps were installed in 1995 and are connected through an oil/water separator to the sanitary sewer.

ConnDOT does not perform regular maintenance on the state vehicles kept at the airport. The motor oil and cleaning solvents stored on site are used only for periodic "topping-off" of vehicle

fluids and periodic cleaning of equipment. Not unlike similar trucks and equipment, most of the vehicles leak small amounts of fluids. The leaking fluids are typically collected with absorbent pellets and disposed of with other wastes.

Refilling of underground fuel storage tanks and the subsequent fueling of vehicles is concentrated in the area of the maintenance garage. No reported spills were identified during the site assessment, and there was no visual indication of spills. Any large spill occurring in the fueling area would most likely be directed to a catch basin located downgradient of the fuel island. Due to the proximity of the catch basin to the fueling area, a spill could result in releases of fuel to surface waters of the area.

The sand storage area could be a potential source of storm water pollution. However, during the site visit, the area surrounding the sand shed was clean and well maintained. Because the sand is located in an enclosed facility that is only opened during sand delivery or sanding operations, this source may not pose a significant pollution problem.

Connecticut Army National Guard

Operations/Responsibilities. Brainard Airport houses a Connecticut Army National Guard facility/hangar that is currently used for equipment and vehicle storage and office space. A vehicle repair garage that occupies the northeast corner of the facility is no longer in use but remains intact.

Facilities. The Army National Guard facility consists primarily of a maintenance hangar with attached office space. The building is located at the north end of Runway 2-20. An extensive outside storage area is located next to the main building. Located in this storage area is a large gravel vehicle parking area, a canopied vehicle washing station, and two large storage sheds used for waste materials. In addition, various waste oil and vehicle fuel tanks exist in the same storage area.

Materials and Equipment. The former National Guard repair and maintenance facility still contains storage of waste oil and dirty rags in 55-gallon drums located inside the building. Additional storage of materials exists outside the building in a large fenced-off storage area. This area contains a 275-gallon double wall above ground waste oil tank and an abandoned above ground waste oil tank. Two underground storage tanks (USTs) are located within the storage area: one containing unleaded gas and the other containing diesel fuel. These two USTs provide fuel to a fuel island which has two dispensers: one for gasoline and one for diesel fuel. Connecticut Army National Guard vehicles are fueled at this location. Also, two large storage sheds are used to store vehicle oil.

A 5,000-gallon underground heating oil tank is located just outside the facility. This tank provides heating fuel for the maintenance building and the attached offices.

Assessment. Most of the materials used by the National Guard are stored in sheds which are

located in a fenced-off storage area. These materials do not appear to be exposed to storm water and most likely do not pose a storm water pollution threat. An above ground waste oil tank, with no secondary containment, is also located in this area. The maintenance garage has two trench floor drains running the length of the facility. There is no indication of where these floor drains discharge.

Operations at the National Guard facility appear to adhere to good housekeeping practices. Observed floor surfaces were clean with no evidence of spills. Also, observed work surfaces were clean and well maintained. Fuel delivery areas include the two underground tanks located in the storage area and the one underground heating oil tank located near the maintenance garage. There were no observed indications of fuel spills in these areas. However, the heating oil tank is located near catch basin systems that could receive any spill that did occur. The two vehicle fuel tanks are on unpaved areas with no nearby drainage system.

Vehicle washing at the National Guard facility now takes place in a newly constructed vehicle washing station. The station is canopied and all wash water is collected and discharged through a 1,500 gallon oil water separator to the sanitary sewer system.

Million Air, Inc.

Operations/Responsibilities. Million Air, Inc. is the Fixed Based Operator (FBO) for Brainard Airport. As the FBO, Million Air provides fueling and line services, aircraft storage, flight instruction, aircraft maintenance, and other services. Million Air operates two fuel farm facilities and mobile fuel trucks to provide aircraft fueling services. Million Air is the only fuel service operator at Brainard.

Facilities. Million Air operates and maintains three aircraft hangars. The aircraft hangars are located on the west side of Runway 2-20. The buildings consist of a large aircraft hangar designated as Million Air North and two hangars, one with attached office space designated as Million Air South.

In addition to the equipment used for general maintenance, Million Air owns aircraft refueling trucks. The trucks are generally parked on the apron area outside the hangar when they are not being used for refueling. These trucks are filled from one of two fuel farms. The first fuel farm consists of two 12,000-gallon above ground fuel tanks located at the far northwestern end of the airport. One of these tanks contains Jet A aviation fuel and the other contains 100 octane low lead fuel. It is estimated that approximately 500,000 gallons of aircraft fuel is used from these two tanks annually.

Million Air also operates a second fuel farm which has six 6,000-gallon underground tanks. The underground tanks are located just south of the above ground fuel farm. It is estimated that approximately 500,000 gallons of fuel are dispensed from these tanks annually.

Million Air South

Facilities. The two buildings that comprise Million Air South include a leased aircraft storage hangar, and a larger hangar with attached offices and avionics shop.

Materials and Equipment. Some general aircraft maintenance is performed in the main hangar but, this is primarily restricted to oil changes, minor painting, and other regular aircraft maintenance. Materials stored on site during the site visits included waste oil, detergents, and ethylene glycol. Additionally, VIP Aero, an avionics company, operates out of this hangar as a tenant of Million Air.

Assessment. All of the observed materials used by Million Air, except for the aircraft fuel, are stored inside the hangar. A floor drain trench is located in the middle of the hangar. These floor drains are currently being connected to an oil/water separator with discharge to the sanitary sewer, as shown on the site plan (Figure 1).

Currently aircraft washing at this facility occurs both inside the hangar and on outside aircraft tie-down areas and aprons. When washing is performed outside, rinse water is carried to both the drainage system and the grassed areas located between runways and along taxiways.

Observations of the fuel farm areas did not indicate evidence of spills or leaks. The new fuel farm area consists of above ground tanks with 110 percent secondary containment. Spills in this area are directed to a catch basin connected back into the containment area. There have been no reported spills or leaks of fuel from this area in the past five years. However, a potential problem exists with the mobile fueling trucks. When they are not in use, they are parked on a paved area just north of the Million Air hangars. This parking area is in direct line with a storm drainage system which discharges to the Connecticut River. The above ground waste oil tank located outside the Million Air hangar does not have secondary containment but is reportedly scheduled to be replaced with a double wall tank in January 1996.

In addition to fueling activities, aircraft deicing is performed by Million Air. Deicing is performed in the hangars. According to airport personnel, about 20 to 50 gallons of deicing fluid (½ ethylene glycol and ½ water) are used on a yearly basis. The preferred method for deicing is the "warming-up" of aircraft inside the hangar.

Maintenance areas appeared clean and well maintained. Floors also appeared clear of obstructions.

Million Air North

Facilities. Million Air North is comprised of one aircraft hangar located on the west side of Runway 2-20 and an office building with a restaurant.

Materials and Equipment. Some general aircraft maintenance is performed in the Million Air

North hangar by CT Air Motive, a subtenant but, this is primarily restricted to routine maintenance and washing. Waste oil, detergent, and ethylene glycol are stored in the facility in 55-gallon drums. In addition, a 275-gallon above ground waste oil tank is located outside the maintenance building near the fuel farm.

Six floor drains are located in the facility. The floor drains discharge to a holding tank that is periodically pumped and disposed of by an approved waste contractor. The floor drains primarily collect wash waters generated during aircraft washing.

Assessment. Materials and equipment used and stored at Million Air Inc. do not appear to pose a significant source of storm water contaminants. The fuel farm consists of underground tanks and no drainage system is located nearby. The potential for spills to enter the drainage system from this area appears to be minimal. Additionally, the floor drain system discharges to a holding tank. The most significant potential for pollutant discharges from this facility appears to be the above ground waste oil tank. The waste oil tank does not have secondary containment to protect against leaks or spills.

CT Air Group

Operations/Responsibilities. CT Air Group is a subcontractor of Million Air. CT Air Group operates an aircraft charter and management service. As of November 17, 1995, CT Air Group has not officially started operations at Brainard. Because CT Air Group was not operating during the November 1995 site visit, no assessment of their operation is included in this SWPPP.

BRAINARD GENERAL AVIATION AIRPORT

POTENTIAL POLLUTION SOURCES

BRAINARD GENERAL AVIATION AIRPORT
POTENTIAL POLLUTION SOURCES
(Based on 11/17/95 site visit)

General Information

During the November 17, 1995 site visit, the following potential pollution sources were observed at Brainard Airport:

- Floor drains at the Army National Guard maintenance hangar discharge to unknown locations. No plans for this facility were available for review. Therefore, these floor drains pose a potential to contribute pollutants to ground or surface waters.

- No stains were evident at the aircraft or vehicle refueling areas. However, the potential for spills or leaks does exist. This could be a potential problem, especially with the ConnDOT vehicle fueling island and the Million Air, Inc. mobile aircraft fueling trucks. Catch basins that connect to the airport drainage system are located immediately downgradient of the ConnDOT fueling island. Also, the mobile fuel trucks generally park on an aircraft tie-down area near drainage system catch basins. Potential leaks or spills in these areas may discharge to the Connecticut River before being contained.

- According to airport personnel, deicing activities at Brainard Airport are performed inside hangars. However, runoff from the facility, during the winter months, may be contaminated with glycol based deicing fluids which have spilled on paved surfaces. Although glycol based fluids are used sparingly at this airport (an estimated 20-50 gallons per year) this may be a source of storm water pollution.

- Outside storage of waste oil in above ground tanks is prevalent throughout the airport. The primary locations for waste oil storage are behind the Army National Guard facility and near the Million Air North hangar. In addition to the waste oil storage, waste gasoline is stored in sealed 55-gallon drums at both aircraft fuel farms. Reportedly, drums and tanks are sealed to prevent material contact with storm water. However, secondary containment to protect surface and ground waters in the event of a tank leak do not exist for these waste products.

- Aircraft and equipment washing with an industrial degreaser/detergent is a common practice of the tenants at Brainard Airport. Washing is generally performed outside in grassed areas on clear, warm weather days and inside the hangars when raining or cold. The cleaning agent and resulting wash water may contribute contaminants to receiving waters if washing is conducted outside. When washing is performed in the hangars, the wash water is discharged through the floor drains.

- Vehicle fueling at the Connecticut Army National Guard takes place on an unpaved apron. Based on this observation, the potential exists for spills from overfilling or other

sources to introduce contaminants to the environment.

A summary of the potential pollution sources described above is provided in the accompanying tables. These tables also include a listing of existing management practices used to mitigate the affects of the potential pollutant sources. Finally, suggested best management practices which could be used to control the pollutant sources are included.

Material Inventory and History Data

All materials stored at the airport also pose potential pollution problems. The above discussion called particular attention to the materials stored outside in 55-gallon drums and above ground tanks. However, even materials stored inside can cause storm water runoff pollution during its delivery or use.

A list of potential pollutants also includes materials stored at the airport. To help maintain an inventory and history of these potential pollutant sources, three tables are included in this section. These tables are: 1) Material Inventory; 2) Exposed Significant Materials, and; 3) Significant Leaks and Spills. A brief description of the purpose of each table is provided below. The tables have been completed with information gathered during the site assessment. These tables should be reviewed and updated as part of the semi-annual inspection.

Material Inventory. The material inventory list is used to identify materials that are handled, treated, stored, or disposed of at Brainard Airport. The enclosed list is based on information gathered during the initial site assessment and are typical of the materials used on-site. In addition to identifying the materials at the airport, the "Material Inventory" table also summarizes the assessment of the potential for exposure of each material to storm water.

Exposed Significant Material. This table is a follow-up to the material inventory list. This table lists significant materials that are exposed to precipitation, identifies the quantity and locations of the materials, identifies the method of storage for the material being exposed, and describes the current management techniques used to minimize contact between materials and precipitation.

Significant Leaks and Spills. Leaks and spills of materials, if not contained quickly and cleaned-up thoroughly, may result in the release of pollutants to storm water. This table is a summary of significant (greater than 5-gallons) leaks and spills at the airport. The General Permit requires that a three year summary of significant leaks and spills be maintained. Therefore, this list must be updated annually. Based on information gathered during the site assessment, no significant leaks and spills were recorded at the site.

BRAINARD GENERAL AVIATION AIRPORT POTENTIAL POLLUTANT SOURCE IDENTIFICATION	Completed by: Metcalf & Eddy, Inc Title: Consultant Date: November 17, 1995

Instructions: **List all identified storm water pollutant sources and describe existing management practices that address those sources. In the third column, list BMP options that can be incorporated into the plan to address remaining sources of pollutants.**

Storm Water Pollutant Sources	Existing Management Practices	Description of New BMP Options
1. Gasoline and diesel fuel at ConnDOT fueling station	None known	• Provide raised berm around catch basins down gradient of fuel island if practical. • Avoid "topping-off" vehicles during fueling operations. • Use portable mats to cover down-gradient catch basin during vehicle fueling operations.
2. Gasoline and diesel fuel at the CT Army National Guard fueling station	None known	• Pave apron around fuel island. • Avoid "topping off" vehicles during fueling operations.
3. Fuel truck parking area and aircraft fueling operations	None known	• Park full refueling trucks away from catch basins and drainage system if possible. • Use portable mats to cover catch basin inlets near aircraft during refueling operations.
4. Wash water from aircraft cleaning	None known	• Only perform washing inside hangars which have floor drains discharging to holding tanks or to sanitary sewer.
5. Deicing activities	None known	• Perform deicing only inside hangars which have floor drains discharging to holding tanks or sanitary sewers.
6. Above ground waste oil tanks	None known	• Provide secondary containment.
7. Fuel, motor oil, hydraulic oil at all maintenance facilities	Use absorbent pellets to collect drippings	• Service equipment to minimize drips.

BRAINARD GENERAL AVIATION AIRPORT MATERIAL INVENTORY	Completed by: Metcalf & Eddy, Inc Title: Consultant Date: November 17, 1995

Instructions: **SEE SITE MSDS SHEETS AT FIRE FACILITY AND NATIONAL GUARD FACILITY**

Material	Purpose/Location	Quantity (Units)			Quantity Exposed in Last 3 Years	Likelihood of contact with storm water. If yes, describe reason	Past Significant Spill or Leak	
		Used	Produced	Stored			Yes	No

SEE MSDS SHEETS @ FIRE AND NATIONAL GUARD FACILITIES

BRAINARD GENERAL AVIATION AIRPORT
DESCRIPTION OF EXPOSED SIGNIFICANT MATERIAL

Completed by: Metcalf & Eddy, Inc
Title: Consultant
Date: November 1995

Instructions: Based on your material inventory, describe the significant materials that were exposed to storm water during the past three years and/or are currently exposed. For the definition of "significant materials" see Appendix B of the Manual.

Description of Exposed Significant Material	Period of Exposure	Quantity Exposed (units)	Location (as indicated on the site map)	Method of Storage or Disposal (e.g., pile, drum, tank)	Description of Material Management Practice (e.g., pile covered, drum sealed)
Waste Oil	Continuous	500 gallons	Behind National Guard Facility and Outside Air One, Inc. Facility	(2) 250-gallon above ground tanks	Sealed Tanks

BRAINARD AIRPORT LIST OF SIGNIFICANT SPILLS AND LEAKS	Completed by: Metcalf & Eddy, Inc Title: Consultant Date: November 17, 1995

Directions: Record below all significant spills and significant leaks of toxic or hazardous pollutants that have occurred at the facility in the three years prior to November 17, 1995.

Definitions: Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of reportable quantities.

1st Year Prior										
11/94 TO 11/95				Description				Response Procedure		
Date (month/day/year)	Spill	Leak	Location (as indicated on site map)	Type of Material	Quantity	Source, If Known	Reason	Amount of Material Recovered	Material no Longer Exposed to Storm Water (True/False)	Preventive Measures Taken
NONE (1)										

2nd Year Prior										
11/93 TO 11/94				Description				Response Procedure		
Date (month/day/year)	Spill	Leak	Location (as indicated on site map)	Type of Material	Quantity	Source, If Known	Reason	Amount of Material Recovered	Material no Longer Exposed to Storm Water (True/False)	Preventive Measures Taken
NONE										

3rd Year Prior										
11/92 TO 11/93				Description				Response Procedure		
Date (month/day/year)	Spill	Leak	Location (as indicated on site map)	Type of Material	Quantity	Source, if Known	Reason	Amount of Material Recovered	Material no Longer Exposed to Storm Water (True/False)	Preventive Measures Taken

BRAINARD GENERAL AVIATION AIRPORT

NON-STORM WATER DISCHARGES

BRAINARD GENERAL AVIATION AIRPORT
NON-STORM WATER DISCHARGES

General Information

The *General Permit for Storm Water Discharges Associated with Industrial Activity* requires all storm water discharges, originating from a site covered by the Permit, to be evaluated and tested to ensure that only storm water, groundwater, or permitted non-storm water components discharge from the storm drain outlets. Furthermore, it must be certified that no interior building floor drains or interior floor drainage discharges connect to the storm drainage system unless such connection is permitted. The General Permit specifies the exact wording of this certification and requires the signature of a professional engineer licensed to practice in Connecticut (General Permit). This certification also applies to floor drain discharges to unknown locations.

Evaluation of storm water discharges for non-storm water can be accomplished by: reviewing and confirming existing facility site plans; observing, sampling, and analyzing dry-weather discharges; dye testing storm sewers and floor drains; or video inspection.

The storm water drainage systems shown on the enclosed Site Plan are based on plans provided by ConnDOT. An assessment of dry-weather discharges was attempted on March 3, 1993. However, due to conditions at the airport (snow, ice, etc.) an accurate assessment was unable to be completed. M&E did not sample, dye-test, or video the site drainage system for non-storm water discharges. M&E's evaluation of non-storm water discharges is based on field observations and information provided by airport tenants.

No known process waters discharge from the airport. However, floor drains exist in many of the hangars and maintenance facilities. According to current DEP regulations, floor drains must discharge to a holding tank or sanitary sewer via an oil/water separator.

Floor drains exist in the ConnDOT maintenance garage, the ConnDOT Fire and Rescue Facility, the Army National Guard maintenance facility, the Million Air North hangar, the two Million Air South hangars, and the Shoreline Aircraft Maintenance hangar. According to site investigations and conversations with airport personnel, the floor drains in the Million Air North hangar are connected to a holding tank that is periodically pumped out. Also, the floor drains in the Million Air South leased storage hangar are also connected to a holding tank. Floor drain discharges from the Shoreline Aircraft Maintenance hangar, Million Air South and both ConnDOT facilities are currently being connected to oil water separators prior to discharge to the sanitary sewer. Only the floor drains from the Army National Guard facility discharge to unknown or unconfirmed locations.

NON-STORMWATER DISCHARGE EVALUATION

The facility non-storm water discharge evaluation consisted of:

Dry weather observation:	*None*
Review of Plans and/or Records:	*Reviewed plans provided by CTDOT*
Dye/Water Tests:	*None*
Other:	*Information provided by airport tenants.*

PROFESSIONAL ENGINEER CERTIFICATION

I certify that in my professional judgement, the discharge from the site consists only of stormwater, or of stormwater combined only with groundwater seepage and/or wastewater covered by an effective permit issued under Section 22a-430 or Section 22a-430b of the Connecticut General Statutes with the exception noted below. This certification is based on testing or evaluation of the stormwater discharge from the site as described in the SWPPP. I further certify that all potential sources of non-stormwater at the site which are known to me, as well as a description of the results of any test and/or evaluation, and the on-site drainage points that were directly observed during the test have been described in detail in the stormwater pollution prevention plan prepared for the site. I further certify that based on the information included in the SWPPP, I am not aware of any interior building floor drains that exist which are connected to any storm drainage system or which may otherwise direct interior floor drainage to exterior surfaces, unless such floor drain connection has been approved and permitted by the Commissioner with the exceptions noted below. I am aware that there may be significant penalties for false statements in this certification, including the possibility of fine and imprisonment for knowingly making false statements. Known exceptions to the non-stormwater general permit criteria are: Floor drains located in the Connecticut Army National Guard facility discharge to unknown location(s). Also, washing of aircraft, vehicle and equipment takes place outside where waste waters are not collected.

Name: JOHN F. REILLY

Company: Metcalf & Eddy, Inc.

Telephone: (203) 269-7310

Signature: John F. Reilly

Date: 12-15-95

CT Professional Engineer
License No. 16742

ADDENDUM TO NON-STORMWATER CERTIFICATION

Floor drains in the Connecticut Army National Guard facility discharge to an unknown location. These floor drains must either be permanently abandoned, routed to a holding tank, or connected to a sanitary sewer. If connected to a sanitary sewer, a CTDEP discharge permit is required.

Also, aircraft, vehicles and equipment are washed outside on the ramps where wastes are not collected. CTDEP has indicated that this practice does not comply with this permit. According to CTDEP, all wash waters must be collected.

The following is the proposed corrective action schedule for these issues:

ITEM	DATE
Identify corrective action alternative (i.e. holding tank, abandonment, etc.):	
Design chosen corrective action:	
Implement corrective action:

Konheim & Ketcham
Wyle Laboratories
Goodkind & O'Dea

July 1999

Chapter Five - Economic Overview broadly estimates the airport's current economic contribution to the Greater Hartford region. This analysis is being provided by Connecticut DOT.

Chapter Six - Forecasts defines the current airport role and develops forecasts of future airport activity. Forecasts are developed for the five, ten, and twenty year planning periods. The Forecasts are the basis of the analyses presented in Chapters Seven and Eight.

Chapter Seven - Facility Analysis assesses the facilities required to meet the selected forecasts. In addition, facilities needing repairs or upgrading to meet FAA design standards or criteria are identified.

Chapter Eight - Alternatives Analysis performs an objective analysis of the Facility Analysis and develops alternative airfield configurations. The result of the analysis of alternatives is a conceptual airport plan.

Chapter Nine - Environmental Review broadly reviews the environmental affects of the recommended conceptual airport layout and defines the potential extent of future environmental analyses and regulatory issues. Modifications to the conceptual plan are developed, if necessary.

Chapter Ten - Airport Layout Plan presents and describes a set of drawings prepared in compliance with standards set forth in FAA AC 150/5070-6A.

Chapter Eleven - Implementation Plan derives and summarizes actions to be performed by the Airport and CTDOT to achieve the recommendations of the Master Plan, and estimates the costs associated with these actions. Recommendations may include future studies or airport policy modifications.

Appendices provide technical information and other supplemental materials.

1.2 History of Hartford - Brainard Airport

Hartford - Brainard Airport was dedicated on June 10, 1921 as Brainard Field, named after Mayor Brainard. The original site of the airport was north of the existing airport's location, in the vicinity of Hartford Electric's South Meadows power station. A blue-ribbon commission had been appointed by Mayor Brainard to establish airport facilities to serve the Hartford area.

This field was dedicated the first municipal "flying field" in New England and also holds historical significance as being the first landing spot after Charles Lindbergh's historic first transatlantic flight. In its early years, the Airport hosted numerous air meets and saw the organization of the Connecticut National Guard Air Squadron in 1923.

Due to the proximity of the Connecticut River, the elevation of the airport, and its location in the river's flood plain, the airfield was prone to serious flooding. The flood of 1936 prompted the Corps of Engineers to build the Clark Dike around the north and east sides of the property to prevent future flooding.

The original site totaled 351 acres and accommodated four landing strips, three of which have since been abandoned. There was the existing Runway 2/20, Runway 9/27 (100' x 3,600') connected to the Runway 20 end, Runway 15-33 (100' x 3,900') connected to the Runway 9 end and Runway 5-23 (150' x 4,800') also connected to the Runway 20 end. The terminal was located in the area between Runway 9/27 and Maxim Road.

In 1959, the configuration of the airport changed dramatically. The State of Connecticut purchased the Airport, including approximately 200 acres, the existing Runway 2/20 and a large portion of the adjacent

land to the west. The City of Hartford retained the additional 150 acres between Brainard Road and the existing airport access road. It was at this time that the three runways were abandoned. The crosswind Runway 11/29 (70' x 2315') was constructed in 1966 to provide landing capability by small aircraft in extreme East/West wind conditions.

1.3 Airport Organization and Administration

The Hartford-Brainard Airport is owned by the State of Connecticut and operated by the Connecticut Department of Transportation (CTDOT). The Department is responsible for the Airport's day to day operations, maintenance, and airport planning and development.

1.3.1 Connecticut Department of Transportation

Overall administration and decision-making for Hartford-Brainard Airport is administered by the CTDOT. There are two specific Bureaus which develop and maintain the Airport: the Bureau of Aviation and Ports, and the Bureau of Policy and Planning.

The Bureau of Aviation and Ports operates and maintains the airport. The Bureau accomplishes the following:

- Airport Management
- Airport Maintenance and Upkeep
- Lease Development and Management
- Airport Rescue and Firefighting
- Snow Operations

The Bureau of Policy and Planning develops and addresses the physical and environmental planning for the airport. This Bureau is responsible for:

- Facility Planning: Short Term and Long Term (Master Planing)
- Special Aviation Studies
- Environmental Studies and Reports

1.3.2 Aviation Services

There are several business on the airport which provide aviation services to the flying public. Their services include aircraft maintenance, aircraft storage and tiedown, and aircraft fueling. The businesses providing services at the airport include the following:

Million Air Aviation Services (Million Air North & South)

Million Air services include short term and long term hangar storage in their hangar facility, aircraft tiedowns (both short and long term) and fueling. Million Air also performs aircraft maintenance, avionics repair, repair of flight instruments, and sales of pilot supplies. Additional information about this and other businesses is provided in Chapter Three.

Shoreline Aviation

Shoreline Aviation provides charter of aircraft, flight instruction, and aircraft maintenance. Shoreline is located in the South FBO Complex.

Total Aircraft

Total Aircraft provides aircraft maintenance on based and transient aircraft. Their services include major work on aircraft engines and airframes. They are located in the Million Air North Complex.

VIP Avionics and Excel Avionics

VIP and Excel provide avionics service and repair to aircraft owners.

1.4 Airport Role Statement

An important task of this Master Plan Update was to develop an Airport Role Statement. The Role Statement should be concise and clearly state the purpose of the airport and how it serves the region and its citizens. This differs from the FAA's defined role of the airport, which is a categorization in comparison to other airports nationally. The Airport Role Statement is analogous to a corporate Mission Statement.

The following Draft Airport Role Statement was developed by the Consulting Team and reviewed by the Airport Master Plan Update Working Group, which is comprised of local citizens, airport users, government agencies, and environmental organizations.

Draft Airport Role Statement
for
Hartford-Brainard Airport

Hartford-Brainard Airport is a business-oriented airport that serves as a gateway to Metropolitan Hartford. Its role is to support and enhance the region's economic development in a planned and environmentally sensitive manner, and to provide economic, educational and cultural opportunities for the region's citizens.

While accomplishing this role, Hartford-Brainard Airport will:

- Develop and maintain facilities that meet the needs of its users;
- Focus on the safety of the airport users and local citizens;
- Minimize environmental impacts; and
- Continue its ongoing dialogue with and between residents, businesses, and the aviation community.

Version Dated January 6, 1998

Chapter Three - Airport Overview

3.1 Introduction

This chapter presents a description of the existing conditions at Hartford - Brainard Airport (HFD). The analysis provides a general understanding of the layout and conditions of facilities including airfield pavements, buildings and navigational aids. The airspace surrounding the Airport is identified and explained. Projects which have been completed since the last Master Plan are also noted.

The "current conditions" at an airport change constantly. As such, the term "existing" as used in this report generally represents fourth quarter 1998 conditions.

3.1.1 Airport Location

Connecticut's state capital, Hartford, is centrally located in the state on the west bank of the Connecticut River. HFD is located approximately two miles southeast of downtown Hartford near the intersections of Interstates I-84 and I-91. The Airport is situated approximately 10 miles south of Bradley International Airport (BDL). The Airport offers a prime location for corporations that need quick, easy access to downtown Hartford.

The airport's 200+ acres are owned by the State of Connecticut, but the runway approaches overlie four separate towns. These towns are: Hartford, East Hartford, Glastonbury and Wethersfield. Figure 3.01 shows the general location of HFD.

3.1.2 Aviation Activity

HFD has a wide range of aviation activities. Although it is not served by scheduled passenger carriers, the Airport is a base for private, corporate and national guard aircraft. The majority of operations at HFD are by general aviation aircraft with some corporate twin-engine and jet aircraft. The FAA defines general aviation as all activities other than air carrier or military and consists mainly of small single and twin-engine piston aircraft used for personal or business use.

A description of the businesses providing aviation related services at HFD is included in *Chapter 1 - Introduction*.

3.1.3 Airport Property and Vicinity

As stated in *Chapter One - Introduction*, the State of Connecticut purchased 200+ acres in March, 1959 to remain as airport property. This airport property is bound to the north and east by the Clark Dike which protects the Airport from flood waters of the Connecticut River. The airport property is bound to the west by Brainard Road and to the south by the Metropolitan District Commission. Adjacent neighbors of the Airport include the Metropolitan District Commission to the south, industrial/commercial sites along Brainard and Murphy Roads to the west, and Maxim Road to the north.

3.1.4 Airport Improvements Since Last Master Plan

The last Master Plan was completed in 1986. While the Plan was under development, and since that time, a significant number of FAA-funded capital improvement projects have been completed. Table 3.01 summarizes these projects. Projects often take several months from beginning to completion; the dates in Table 3.01 represent the beginning of the project.

Table 3.01 - Airport Improvement Projects

Year	Project Description
1986	Rehabilitate and light Helipad Replace and relocate airport beacon
1987	Conduct Part 150 Study
1989	Aircraft Parking Ramp
1990	Purchase ARFF Vehicle Replace HIRLS on Runway 2/20 Rehabilitate MITLS on Taxiways C, D, H, J and W Replace Obstruction Lights on Dike Install taxiway lighting Wind cone and segmented circle Construct lighting vault Construct and light Stub Taxiway D Construct and light Hold Apron for Runway 20 Security Fence
1992	Purchase Snow Broom
1993	Install guidance signs Rehabilitate and mark Runway 2/20 Rehabilitate and mark Stub Taxiways A, C and W
1995	Reconstruct Taxiway A Reconstruct Hold Apron Runway 2 Replace Taxiway Lighting Rehabilitate Taxiway C
1996	Airport Master Plan (Grant Date)
1998	Reconstruct, mark and light Runway 11-29 Reconstruct Taxiway B Reconstruct General Aviation Ramp
1999	Reconstruct, mark and light Taxiway J Reconstruct General Aviation Ramp at Fire Station

EXISTING AIRPORT LAYOUT

Hartford-Brainard Airport
Master Plan Update

Red obstruction lights and white strobes are located at various points around the Airport perimeter to help pilots identify obstructions at night or times of decreased visibility. The number and location of obstruction lights are listed in Table 3.02. Obstruction lights not directly associated with HFD (i.e. on bridges or tall buildings in downtown Hartford) are not covered by this report.

Table 3.02 - Obstruction Lights

3.3 Landside Facilities

This section describes the major landside facilities at HFD. These facilities include the North and South FBO complexes, T-hangars, airport administration, and other leased buildings. All buildings on airport property are located west of Runway 2/20 and north of Runway 11/29. See Figure 3.04 for the locations of landside facilities. A complete building inventory is included in Section 3.3.5.

3.3.1 General Aviation Services

Several businesses on the airport provide a range of services to both based and visiting aircraft. These services include aircraft storage and parking, fueling, aircraft maintenance, flight training and aircraft rental/charter. Businesses providing services at the airport include:

Million Air

Million Air is the operating name for a series of companies that provide a number of different services for aircraft based at the airport and flying to and from the airport. Million Air facilities are divided into two areas, designated Million Air North and South.

Million Air North facilities include a large hangar, a separate office/terminal building, a fuel farm (see Section 3.3.4), and tiedowns. The hangar provides maintenance, avionics, and limited aircraft storage. An aircraft wash stand is adjacent to the hangar. The terminal building provides a waiting area for pilots and passengers as well as pilots supplies, telephones, and vending machines. Logan's Restaurant is located in

the terminal building of the Million Air North complex. Several tenants (noted later in this section) are also located in this area.

Million Air South consists of three hangars, one with an attached one-story office area, and aircraft parking. The hangars provide storage and aircraft maintenance services. The offices are the home to several businesses, described next.

Total Aircraft

Total Aircraft provides aircraft maintenance on based and transient aircraft. Their services include major work on aircraft engines and airframes. They are located in the Million Air North Complex.

Excel Avionics

Excel Avionics provides specialized maintenance and repair services for aircraft instruments and avionics. Excel is located in the Million Air North Complex.

Enterprise Rent a Car

Enterprise Rent-a-Car has a customer service counter in the Million Air North terminal, directly adjacent to the Million Air counter. This counter is staffed 8:00 am to 6:00 pm Monday through Friday and on Saturdays from 9:00 am until Noon. Enterprise has three spaces reserved for ready/return cars in the lot directly adjacent to the terminal. Additional spaces are available on airport property should the need arise to park more than three vehicles simultaneously. Enterprise utilizes local businesses for cleaning, fueling and maintaining vehicles.

Shoreline Aviation

Shoreline Aviation provides aircraft maintenance, flight instruction and aircraft charter. They also provide regular (seasonal) seaplane service to and from Manhattan. In addition, they have recently begun the sale of new aircraft. Their maintenance services include major work on aircraft engines and work associated with aircraft airframes. They are located in the Million Air South Complex.

VIP Avionics

VIP Avionics also provides specialized avionics maintenance and repairs. The company focuses on serving single engine and light twin engine aircraft. They are located in the Million Air South Complex.

Professional Flight Training (PFT)

Located in the Million Air South area, PFT provides flight instruction. PFT recently established an agreement with the University of New Haven to provide flight instruction as part of the University's Associate Degree in Aviation.

3.3.2 Connecticut National Guard Facilities

The Connecticut National Guard facilities at HFD consist of a large hangar/office structure, fueling facilities, and vehicle storage areas. The Guard also uses a portion of the Airport Administration Building (see Section 3.3.3.). The main hangar building has been recently renovated, and there are plans to store Guard helicopters

in the hangar. At that time, auto parking (17 spaces) located in front of the hangar will be removed. This issue, and its effect on airport operations, will be discussed further in thc forecast chapter.

3.3.3 Connecticut DOT/ARFF Facilities

The Connecticut Department of Transportation, Bureau of Aviation and Ports, has administrative offices in the Airport Administration Building. In addition, the State operates the Airport Rescue and Fire Fighting (ARFF) equipment from a former hangar north of the Administration Building. Adjacent to both of these buildings is a small vehicle maintenance garage, also operated by CTDOT.

ARFF Vehicles at HFD consist of a 1991 Ford Rapid Intervention Vehicle equipped with a 500 lb. dry chemical system, and a 1977 Chevrolet Quick Response Vehicle.

3.3.4 Fuel Storage

There are three separate areas designated at the Airport for fuel storage. Table 3.03 and Figure 3.04 identify the fuel storage areas. This Table reflects the most recent removal of older underground storage tanks.

Table 3.03 - Fuel Storage

No.	Above/Below Ground	Capacity (Gal.)	Type	Operator	Location
I	(Removed)				
II	Above	12,000 12,000	Jet A 100 LL	Million Air	North of Fuel Storage Area 1, West of Guard Ramp
III	Below	4,000 4,000	Diesel Unleaded	State of CT	West of Maintenance Shop

Master Plan Update

Air Traffic Control Tower (ATCT)

The ATCT at Hartford-Brainard is operated by a private company, under contract to the FAA. A complete description of this tower and its services is provided in Section 3.6.4.

Table 3.04 - Airport Equipment

Equipment	Year	Condition
Maintenance Vehicles		
Tractor (w/mower attch.)	1964	Fair
Tractor (w/mower attch.)	1979	Fair
Tractor (w/mower attch.)	1981	Fair
(2) Ford Tractor (w/mower attch.)	1986	Good
Tractor (w/mower attch.)	1990	Good
Ford 9 Ton Dump Truck	1975	Unknown
(2) Ford Duo Dump	1980	Fair
Ford Dump Truck	1989	Fair
International Side Dump	1996	Good
Dodge ½ Ton Pick-up	1988	Fair
Bucket Loader w/Fork	1989	Good
John Deere Loader	1986	Good
Maintenance Equipment		
Mott Mower Attachment (4' flail)	1978	Fair
Brush cutter	1989	Good
John Deere Mower (walk behind)	1991	Good
Brush cutter	1992	Good
Brush cutter	1997	Good
Snow Removal		
Walsh Holyoke Snow Plow Attachment	1946	Good
Snow Plow Attachment	1960	Good
Valk Snow Plow Attachment	1970	Good
Sand Spreader, 10' Attachment	1976	Good

T-Hangars

T-Hangars (storage hangars with individual bays for each aircraft) are located south of Million Air South. The Airport has three T-Hangars, each with a capacity for ten aircraft. These hangars are in need of repair.

Table 3.05 - Building Inventory

Building (# from Fig. 3.04)	**Use**	**Condition**
Air Traffic Control Tower (13)	Control Tower	Good
ATCT Base Office (13)	Control Tower Office	Good
Civil Air Patrol (14)	Offices and Classroom	Poor
T-Hangars (12)	Individual Hangar Spaces	Fair/Poor
Million Air South Hangar (11)	Aircraft Maintenance and Storage	Good
Million Air South Hangar (10)	Aircraft Storage & Maintenance	Good
Million Air South Attached offices (10)	Pilots Lounge, Offices	Good
Million Air South/Shoreline (9)	Aircraft Storage & Offices	Excellent
Million Air North Terminal (8)	Lounge, Restaurant, Offices	Very Good
Million Air North Hangar (7)	Aircraft Storage & Maintenance	Very Good
Million Air North Shop Addition (7)	Shop Area	Good
ARFF Office (4)	Offices / Vacant	Fair
ARFF / State Hangar (4)	ARFF & CTDOT Equip. Storage	Fair
Vehicle Maintenance Shop (5)	Maintenance Shop	Good
Administrative Building (3)	CTDOT (Manager), National Guard	Good
Connecticut National Guard (2)	Connecticut National Guard	Good
Vehicle Parking and Misc Bldgs (2)	Vehicle Storage	Fair/Good
Sand Shed (1)	ARFF Radio / Sand Storage	Good

Source: Airport Management, Field Review

3.4 Airport Access and Parking

Hartford - Brainard Airport is very accessible due to its location in relation to downtown Hartford. As shown in Figure 3.01, the major highways which serve the Hartford metropolitan area are I-84 (east/west), I-91 (north/south) and Route 2 (southeast). All three of these routes intersect just north of the Airport. From this intersection, access to the Airport is via I-91 southbound to US Route 5 and State Road 15 known as the Wilbur-Cross Highway, exit onto Murphy Road and turn east onto Maxim Road. A right turn onto the Airport access road will lead to the FBOs, T-Hangars, ATCT and Civil Air Patrol Trailer. Continuing eastbound on Maxim Road will lead to the CTDOT Offices (Airport Management) and the Connecticut National Guard facilities. Airport signs are placed at appropriate locations on both highways and local roads.

Auto parking areas are distributed throughout the Airport. Major parking areas are located adjacent to the CTDOT Administration Building (18 spaces), National Guard (28 spaces), Million Air North (55 spaces) and Million Air South (89 spaces). Parking is also available adjacent to the ATCT for both Tower personnel and temporary storage for State vehicles. There is a large public parking lot (178 spaces) located between Million Air North and Million air South. The United States Post Office leases 70 of these spaces for employee parking.

3.5 Airport Utilities

The following is a summary of the utilities serving the Airport. Information on utilities was obtained from review of the previous Master Plan, airport files, and discussions with airport personnel.

Electric Service

Electric power is provided to the Airport from Northeast Utilities HELCO utility poles located west of the airport access road from Maxim Road to west of the ATCT. These power lines carry 3 phase 23,000 V phase to phase 13,200 volt phase to ground. Service to airport buildings is through underground cables from the utility poles. The electrical vault which controls the airfield lighting is located southwest of the ATCT.

Gas Service

Gas service to the Airport is also provided by Connecticut Natural Gas through four inch and six inch 55-350 p.s.i. gas mains located beneath the airport access road. Service laterals from the gas main serve buildings along the airport access road and Maxim Road.

Water Service

The Metropolitan District Commission provides water to the Airport through an eight inch Tyton water main east of the airport access road and south of Maxim Road with service laterals to buildings.

Sanitary Sewer

Three pump stations are located on airport property to serve the buildings along Lindbergh Drive. The sanitary sewer serving these buildings runs north to intersect a line north of Maxim Road. Pump stations are located at the ATCT, in the Million Air South Complex and the southwest corner of the large parking lot between Million Air North and Million Air South. Airport buildings along the northern periphery are connected to the sewer line just north of, and parallel to , Maxim Road via lateral connections.

3.6 Airspace

Aircraft in flight, approaching or departing an airport are subject to a system of controls designed to serve one primary purpose - the safe separation of one aircraft from another. Aircraft which fly in the United States are subject to varying degrees of control, depending on the specific airspace and meteorological conditions in which they operate. This system of air traffic control is the responsibility of the Federal Aviation Administration (FAA), which has the statutory duty to establish, operate and maintain air traffic control facilities and procedures.

There are two basic types of aircraft flight regimes recognized by the air traffic control system: those operating under visual flight rules (VFR) which depend primarily on the "see and be seen" principle for separation, and those operating under instrument flight rules (IFR) which depend on radar detection for separation by ground controllers. IFR flights are controlled from takeoff to touchdown, while VFR flights are controlled only in the vicinity of airports, as explained in the next section.

The FAA provides guidance and separation for both flight regimes, but the degree of positive control varies in different types of airspace.

4.4 Topography and Surficial Geology

The land around Hartford-Brainard Airport is composed of post-glacial deposits consisting of floodplain alluvium (sand, gravel, silt, and some organic material) over fines (well-sorted, thin layers of alternating silt and clay, or thicker layers of very fine sand and silt).

The Surficial Materials Map of Connecticut shows that a test well was drilled west of the airport, near exit 86 of the Wilbur Cross Parkway. This well showed 22 feet of sand, 18 feet of fines, and 11 feet of thin till over the bedrock.

The 1986 "Hartford-Brainard Airport Master Plan Study" reported that topsoil at the airport is 2-4 inches deep. Beneath the topsoil is a layer of brown silt and fine sand 6-14 feet deep. Beneath the layer of brown silt and fine sand at the northern and southern extremes of the airport is a layer of fine brown sand.

4.5 Surface Water Resources

Hartford-Brainard Airport is bordered to the east by the Connecticut River, the largest river in New England. The Connecticut River flows north to south, from its headwaters in Canada and northern New Hampshire to its mouth in Old Saybrook, CT on the Long Island Sound. The airport is separated and protected from the river and its floodplain by the Clark Dike (approximate elevation 43 feet), which was constructed in the 1930's by the US Army Corps of Engineers after a series of floods.

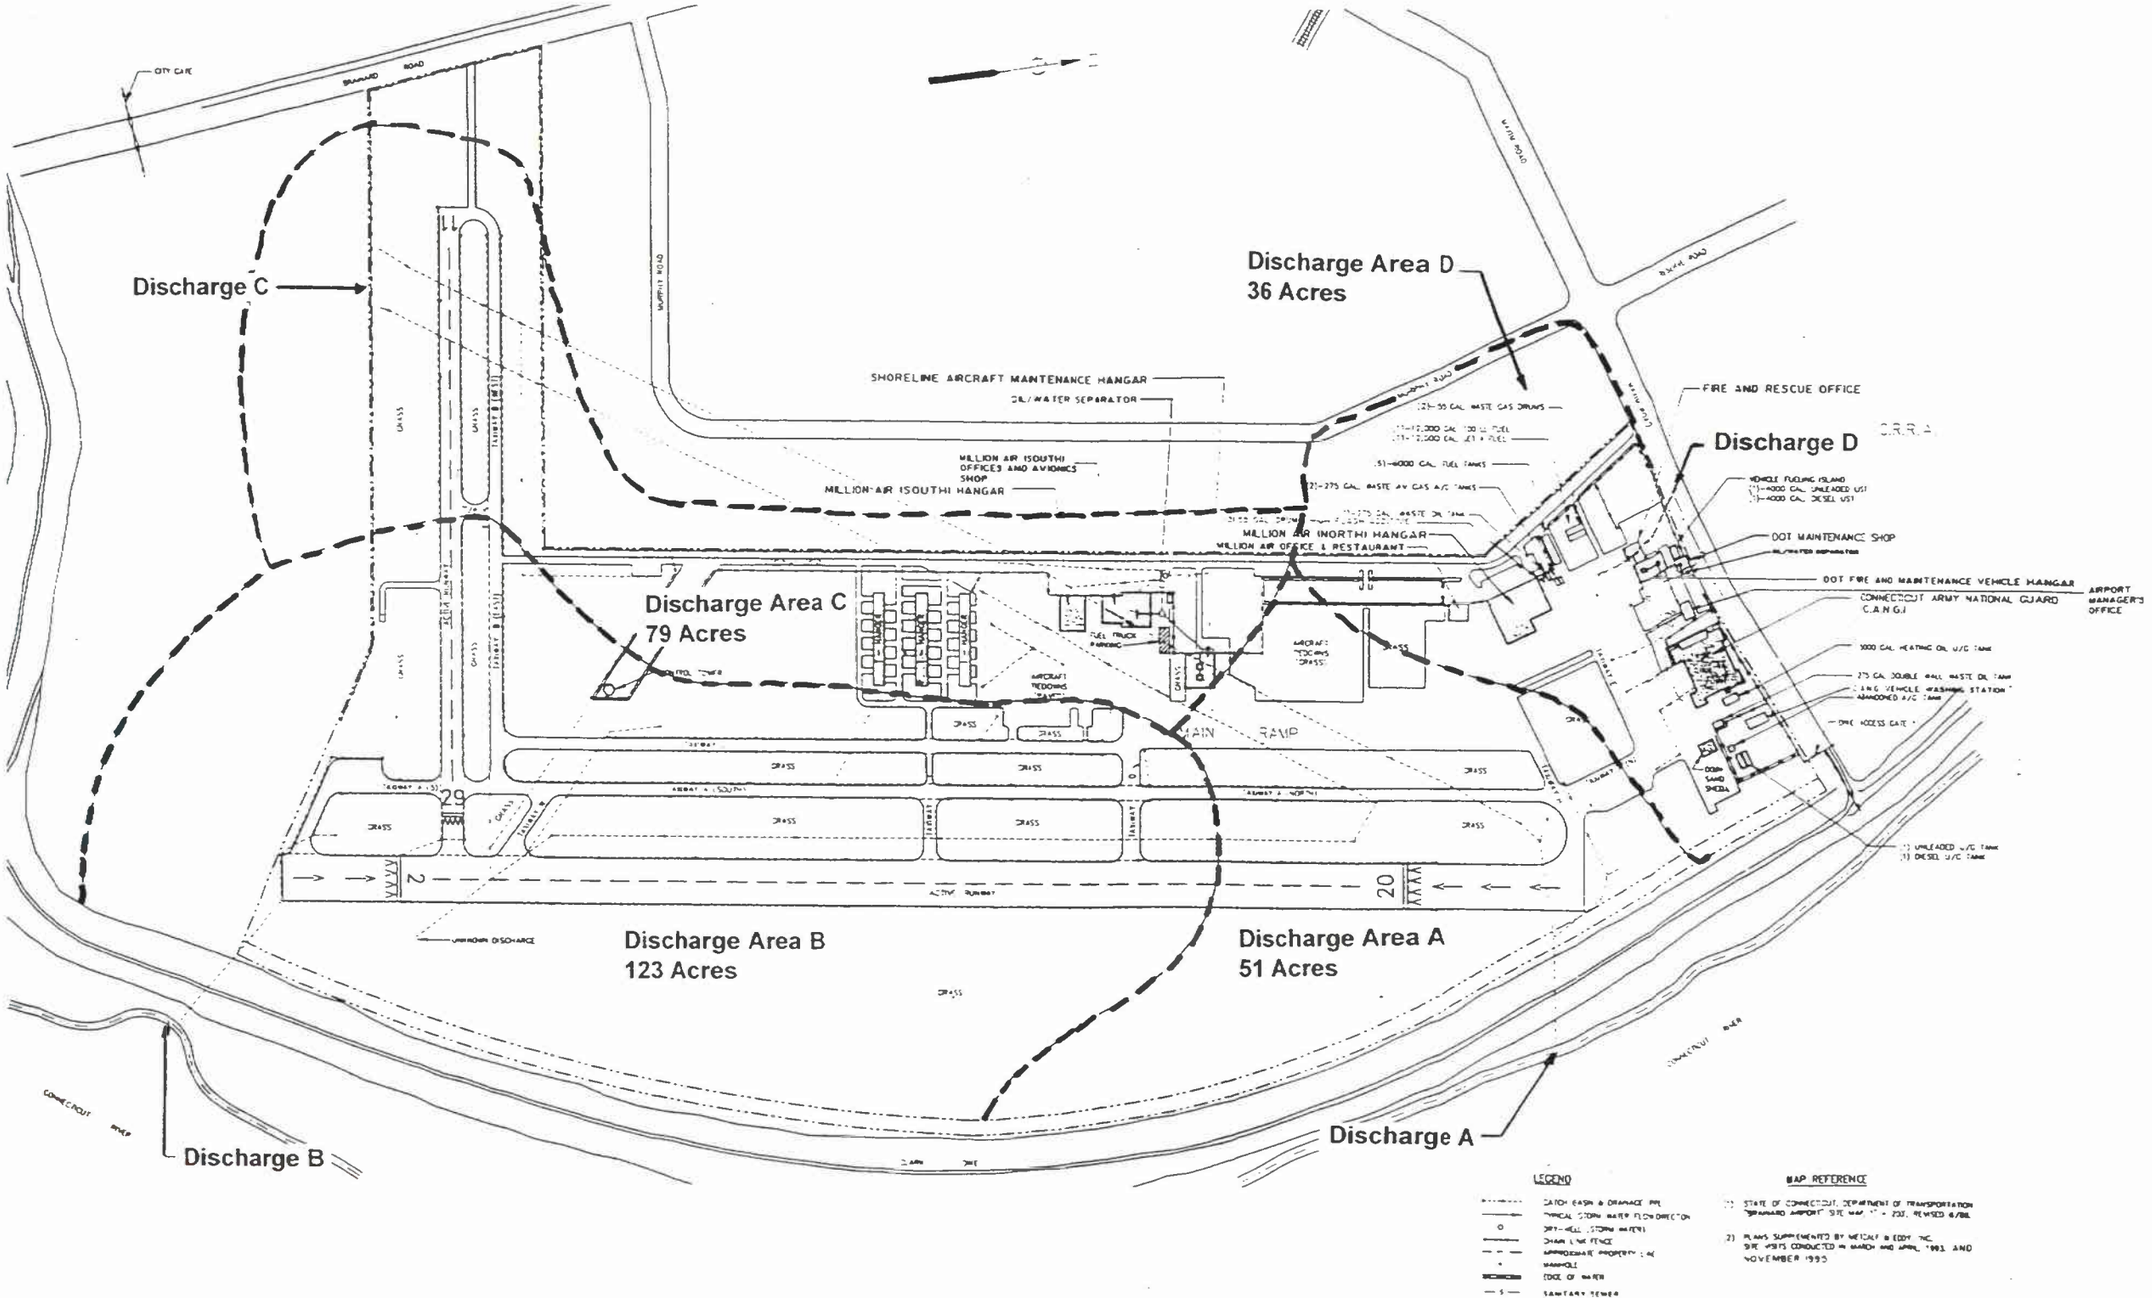
From its confluence with the Farmington River in Windsor, approximately 10 miles north of Hartford-Brainard Airport, to the Long Island Sound, the Connecticut River is influenced by tidal action, creating more than 50 miles of freshwater estuarine environment having great ecological significance.

Data obtained from the DEP Bureau of Water Management indicated that in the vicinity of Hartford, as of April 1997, the Connecticut River is classified as SC/SB for coastal and marine waters by the Connecticut Department of Environmental Protection. Class SC/SB means that the water quality goal for the river is to meet the requirements for class SB. Currently it is not meeting the water quality criteria or supporting one or more designated uses due to pollution.

The designated uses for class SB coastal and marine waters are marine fish, shellfish, and wildlife habitat; shellfish harvesting for transfer to a depuration plant or to approved areas for purification prior to human consumption, recreation, industrial, and other legitimate uses, including navigation.

Permitted discharges to class SB coastal and marine waters are limited to discharges from public or private drinking water treatment systems, dredging and dredge material dewatering operations, cooling water systems, municipal and industrial wastewater treatment systems, and from other sources subject to the provisions of Section 22a-430 of the Connecticut General Statutes.

Hartford-Brainard Airport has four stormwater point discharges. According to the *Stormwater Prevention Plan for Brainard General Aviation Airport*, prepared in 1995, these discharge points and associated drainage areas (designated A, B, C, and D) are identified on Figure 4.03. Two of the four discharges are connected directly to the Metropolitan District Commission (MDC) storm sewer system. The other two drainage areas discharge directly into the Connecticut River.



STORM WATER DRAINAGE PLAN

Hartford-Brainard Airport
Master Plan Update

FIG
4.

N.

Stormwater from area A is discharged into the Connecticut River through a 15-inch pipe. Discharge A drains 51 acres and receives runoff from the major portions of the airport's runways. The primary features located within this drainage area include: the northern portion of Runway 2-20; associated taxiways and grassed infield areas; and the hangar areas west of Runway 2-20, including the Million Air, Inc. hangars.

Stormwater from area B also is discharged directly into the Connecticut River. Stormwater discharge flows through a ten-foot wide canal and enters the Connecticut River through a submerged 15-inch pipe. Airport management noted that this canal often floods during heavy rains. Discharge B drains 123 acres and includes: the southern section of Runway 2-20, most of Runway 11-29, and associated taxiways and infield areas. No airport building areas drain through this discharge.

Discharge C is connected to the MDC storm sewer system at the southwestern end of the airport. This 79-acre discharge area includes runoff from the western end of Runway 11-29; associated airport taxiways and infield areas; and various airport buildings, including the control tower and T-hangars.

Discharge D is connected to the MDC storm sewer system at the northwestern end of the airport. The drainage area for this 36-acre discharge area includes ConnDOT office buildings, the Connecticut Army National Guard Facility, and other nearby office areas.

Significant aircraft deicing is not performed at HFD. However, later chapters address the issue of potential future needs in this area (see Chapter Ten).

4.6 Ground Water Resources

Groundwater in the vicinity of Hartford-Brainard Airport is classified by the Connecticut Department of Environmental Protection (DEP) as class GB. Class GB groundwater is suitable for use as industrial process and cooling water and baseflow for hydraulically-connected surface water bodies. In general, class GB groundwater is not suitable for human consumption without treatment because of waste discharges, spills or leaks of chemicals, or land use impacts.

The DEP issues discharge permits to class GB groundwater for treated domestic sewage; waste generated by certain agricultural practices; certain water treatment waste waters from public water supply treatment systems; certain minor cooling waters or other clean waters; and discharge from a septage treatment system or other wastes that are predominately human, plant, or animal in origin as long as any such wastes are easily biodegradable and pose no threat of pollution to the groundwater. The ground water plume generated by a discharge of septage treatment system must terminate in a stream with classification of B or SB (see definitions below) unless the permittee treats the discharge in a manner which the Commissioner determines is adequate to maintain class A water in the receiving stream. Additionally, waste discharged to class GB ground water must be generated by a source which is unlikely to produce persistent pollutants that do not biodegrade in soil, and the waste will be treated as necessary to render it amenable to attenuation by the receiving soil.

The designated uses for Class B inland surface water are: recreational use; fish and wildlife habitat; agricultural and industrial supply; and other legitimate uses, including navigation. The designated uses for Class SB Coastal and Marine Surface Waters are: Marine fish, shellfish, and wildlife habitat; shellfish harvesting for transfer to a depuration plant or relay to approved areas for purification prior to human consumption; recreation; industrial; and other legitimate uses, including navigation. The designated uses for Class A Inland Surface Waters are: Potential drinking water supply; fish and wildlife habitat; recreational use; agricultural or industrial use; and other legitimate uses, including navigation.

4.7 Wetlands

A small area of seasonally saturated, palustrine (freshwater) is delineated on the National Wetlands Inventory (NWI) map on the southeast corner of airport property, adjacent to the Clark Dike. The June 1997 field review, follow-up visits, and inspection of wetland maps indicate that there are no other state or federally designated wetlands located within the airport property.

Federally designated wetlands are located outside of the airport boundaries along the Connecticut River east of the Clark Dike, near the waste water treatment plant and in Wethersfield Cove south of the airport, and along Maxim Road north and northwest of the airport.

Figure 4.04 shows wetland areas proximate to the airport.

4.8 Floodplains

Hartford-Brainard Airport is located outside of the 500-year and 100-year floodplain, as delineated by the Federal Emergency Management Agency (FEMA) on the Hartford Flood Insurance Rate Map. The 100-year flood is defined as that area that has a one in one hundred probability of occurring in a given year. The limits of the 100-year flood are considered significant in defining flood prone areas and are used as the basis for establishing flood insurance requirements by lending institutions. Although flood plains within the 100 year flood boundary border the Connecticut River in the Hartford region, including areas bordering Hartford-Brainard airport, the airport and surrounding areas are protected from floods by the Clark Dike.

Figure 4.05 shows the FEMA map for the greater Airport area.

4.9 Biotic Communities

Potential wildlife habitat at Hartford Brainard Airport consists mainly of a grassy area adjacent to the Clark Dike, east of Runway 2-20. In the vicinity of Wethersfield Cove, immediately south of the airport, the DEP recognizes the freshwater tidal marshes and floodplain forests as "notable habitats."

4.9.1 Endangered and Threatened Species

Under Connecticut state law, the definitions for Endangered, Threatened, and Species of Special Concern are as follows:

- **Endangered**: Any native species documented by biological research and inventory to be in danger of extirpation throughout all or a significant portion of its range within the state and to have no more than five occurrences in the state, and any species determined to be an "endangered species" pursuant to the federal Endangered Species Act.

- **Threatened**: Any native species documented by biological research and inventory to be likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range within the state and to have no more than nine occurrences in the state, and any species determined to be a "threatened species" pursuant to the federal Endangered Species Act, except for such species determined to be endangered by the Commissioner of the Department of Environmental Protection.

aircraft crashes may represent sites of historic aeronautical importance. Laurence Webster, an aviation historian and archaeologist, maintains a database of historic aircraft crashes in Connecticut. This database lists 23 aircraft crashes at Hartford-Brainard airport from 1922-1993, and additional crashes in the Connecticut River near the airport. Crashes involve civilian and military aviators of historical significance such as John Blaney, Frederick Boots, Carey Pridham, Milton Moore, Paul Baker, and others.

No formal archaeological work has been conducted to determine if any significant historical aviation crash sites remain on airport property, but in crashes where aircraft were not completely destroyed, it is likely that wreckage was deposited in a dump site on or near the present day airport.

The Old Wethersfield Historic District, the largest historic district within the state of Connecticut, is located in the Town of Wethersfield, south of Hartford Brainard Airport, between the Penn Central Railroad right-of-way and the Connecticut River. Settlement in what is now Old Wethersfield began in 1634, when settlers trading furs with the Wongunk Indians recognized the rich soil and timber resources along the Connecticut River and established a town near Wethersfield Cove.

Remnants of this town include nearly 150 preserved homes and other significant historical sites, including The First Church of Christ, where George Washington and John Adams worshiped. Also, Old Wethersfield has one of only three Colonial meeting houses remaining in Connecticut. In addition, there are:

- The Webb-Deane-Stevens Museum. George Washington visited the Joseph Webb house in 1781 to consult General Rochambeau about the British surrender at Yorktown.
- Wethersfield Cove and Warehouse.
- Wethersfield Seed Gardens.

4.12 Air Quality

Data on air quality was obtained from DEP's Bureau of Air Management. The data indicated that the State of Connecticut currently is designated to be in compliance with the National Ambient Air Quality Standards (NAAQSs) for Nitrogen Dioxide (NO_2), Lead (Pb), Carbon Monoxide (CO), Particulate Matter no greater than 10 micrometers in diameter (PM_{10}), and Sulfur Dioxide (SO_2). The criteria pollutant for which the state is out of compliance is Ozone, or photochemical smog (O_3). Connecticut is part of the Ozone Transport Region which extends from Virginia to Maine. Ozone measured in Connecticut primarily is the product of emissions generated to the southwest that are converted to O_3 in transport.

The current data show an improvement in air quality from 1995, when the last *Connecticut Annual Air Quality Summary* was published. In 1995, Connecticut was out of compliance with the NAAQSs for PM10 and CO, in addition to Ozone.

4.13 Hazardous Wastes and Petroleum Products

Aircraft fueling operations at Hartford-Brainard Airport are operated by Million Air, Inc. Million Air operates the airport's fuel farm, located in the northwestern portion of the airport. The fuel farm consists of two 12,000-gallon above ground fuel tanks. One tank contains Jet A aviation fuel and the other contains 100 octane low lead fuel. A second fuel farm, consisting of six 6,000-gallon underground tanks, was recently removed.

Fuel is transferred from the fuel farms to aircraft by Million Air's fueling trucks. When not in use, these trucks are generally parked on the apron area outside of the Million Air hangars.

In addition to the aircraft fueling operations, vehicle fuel, heating fuel, and other hazardous materials are stored at various locations by Million Air, ConnDOT, and the Connecticut National Guard.

Materials stored at other the Million Air hangars include waste oil, detergents, and ethylene glycol. Additionally, a 275-gallon above ground waste oil tank is located outside of the maintenance building near the fuel farm.

ConnDOT stores low-lead gasoline and diesel motor fuel in two 4,000-gallon underground tanks located outside of the ConnDOT maintenance facility. A fuel dispensing island is also located in this area. In addition to fuel, other materials typically handled and stored by ConnDOT include heating oil, waste oil, cleaning solvents, ethylene glycol, and fire fighting foam. Waste oil, mineral spirits, and paint are located inside the maintenance garage in closed 55-gallon drums. A complete list of materials used on-site is kept in Material Safety Data Sheet (MSDS) records, which are located in the Airport Rescue and Fire Fighting (ARFF) facility.

The National Guard facility still contains stored waste oil and dirty rags in 55-gallon drums located inside the building. Other materials are stored outside of the building in a large fenced-off area. This area contains a 275-gallon double wall above ground waste oil tank and an abandoned above ground waste oil tank. Two large storage sheds are also used to store vehicle oil. Two underground storage tanks containing unleaded gasoline and diesel fuel are located within the storage area. Connecticut Army National Guard vehicles are fueled at the fuel island connected to these tanks.

No known hazardous waste issues were identified at Hartford-Brainard Airport in the 1995 Storm Water Pollution Prevention Plan.

4.14 Environmental Permitting in Connecticut

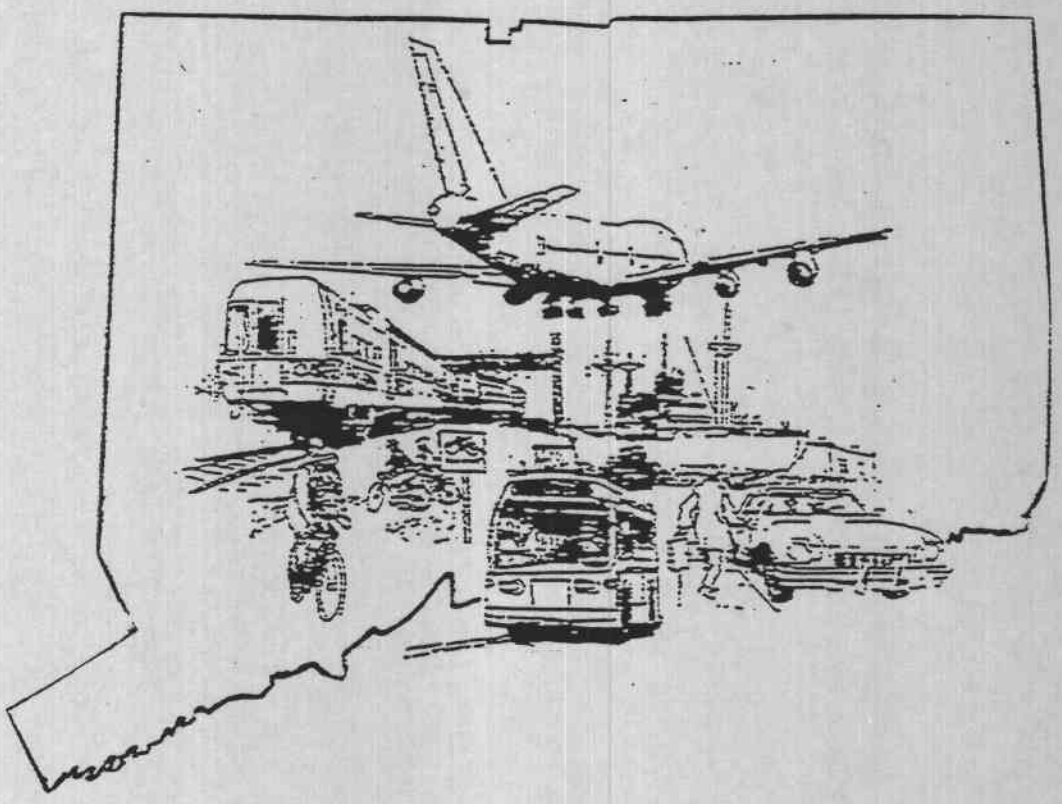
The Commissioner of the Connecticut Department of Environmental Protection (DEP) regulates activities that may affect the state's natural resources and environment through 29 different permitting programs, as well as other environmental policies. The federal government and municipalities also regulate activities that can affect the environment.

Many airport-related capital projects require federal, state, or local environmental permits. While the applicability of specific environmental and construction permits is based on detailed plans developed for specific airport projects, the following is a general list of permits and certifications which may be applicable to planned capital projects at Hartford-Brainard Airport:

State of Connecticut

- Connecticut Environmental Policy Act (CEPA)
- Air Emissions - New Source Review Program
- Special Wastes or Asbestos Disposal Authorization
- Wastewater Discharges
- Flood Management Certification
- Section 401 Inland Water Quality Certification (state certification of federal permits)
- Inland Wetlands and Watercourses
- Stream Channel Encroachment Lines
- Waste Transportation (not required for a generator of hazardous waste who transports less than 1,000 kg of waste/month to an off-site waste facility).

DRAFT 2001
MASTER
TRANSPORTATION
PLAN



2002 -2011

STATE OF CONNECTICUT

DEPARTMENT OF TRANSPORTATION

III. STATUS OF THE EXISTING TRANSPORTATION SYSTEM

In this chapter the Department's roles with respect to the State of Connecticut's airports, bridges, highways, bus systems, rail systems, water transportation services and facilities, bikeways, walkways and trails are summarized; overviews of the physical conditions of the components of these systems are presented, factors affecting the conditions of or demand on the facilities are identified and the ability of these facilities and systems to meet current and future demands is discussed.

A. AIRPORTS

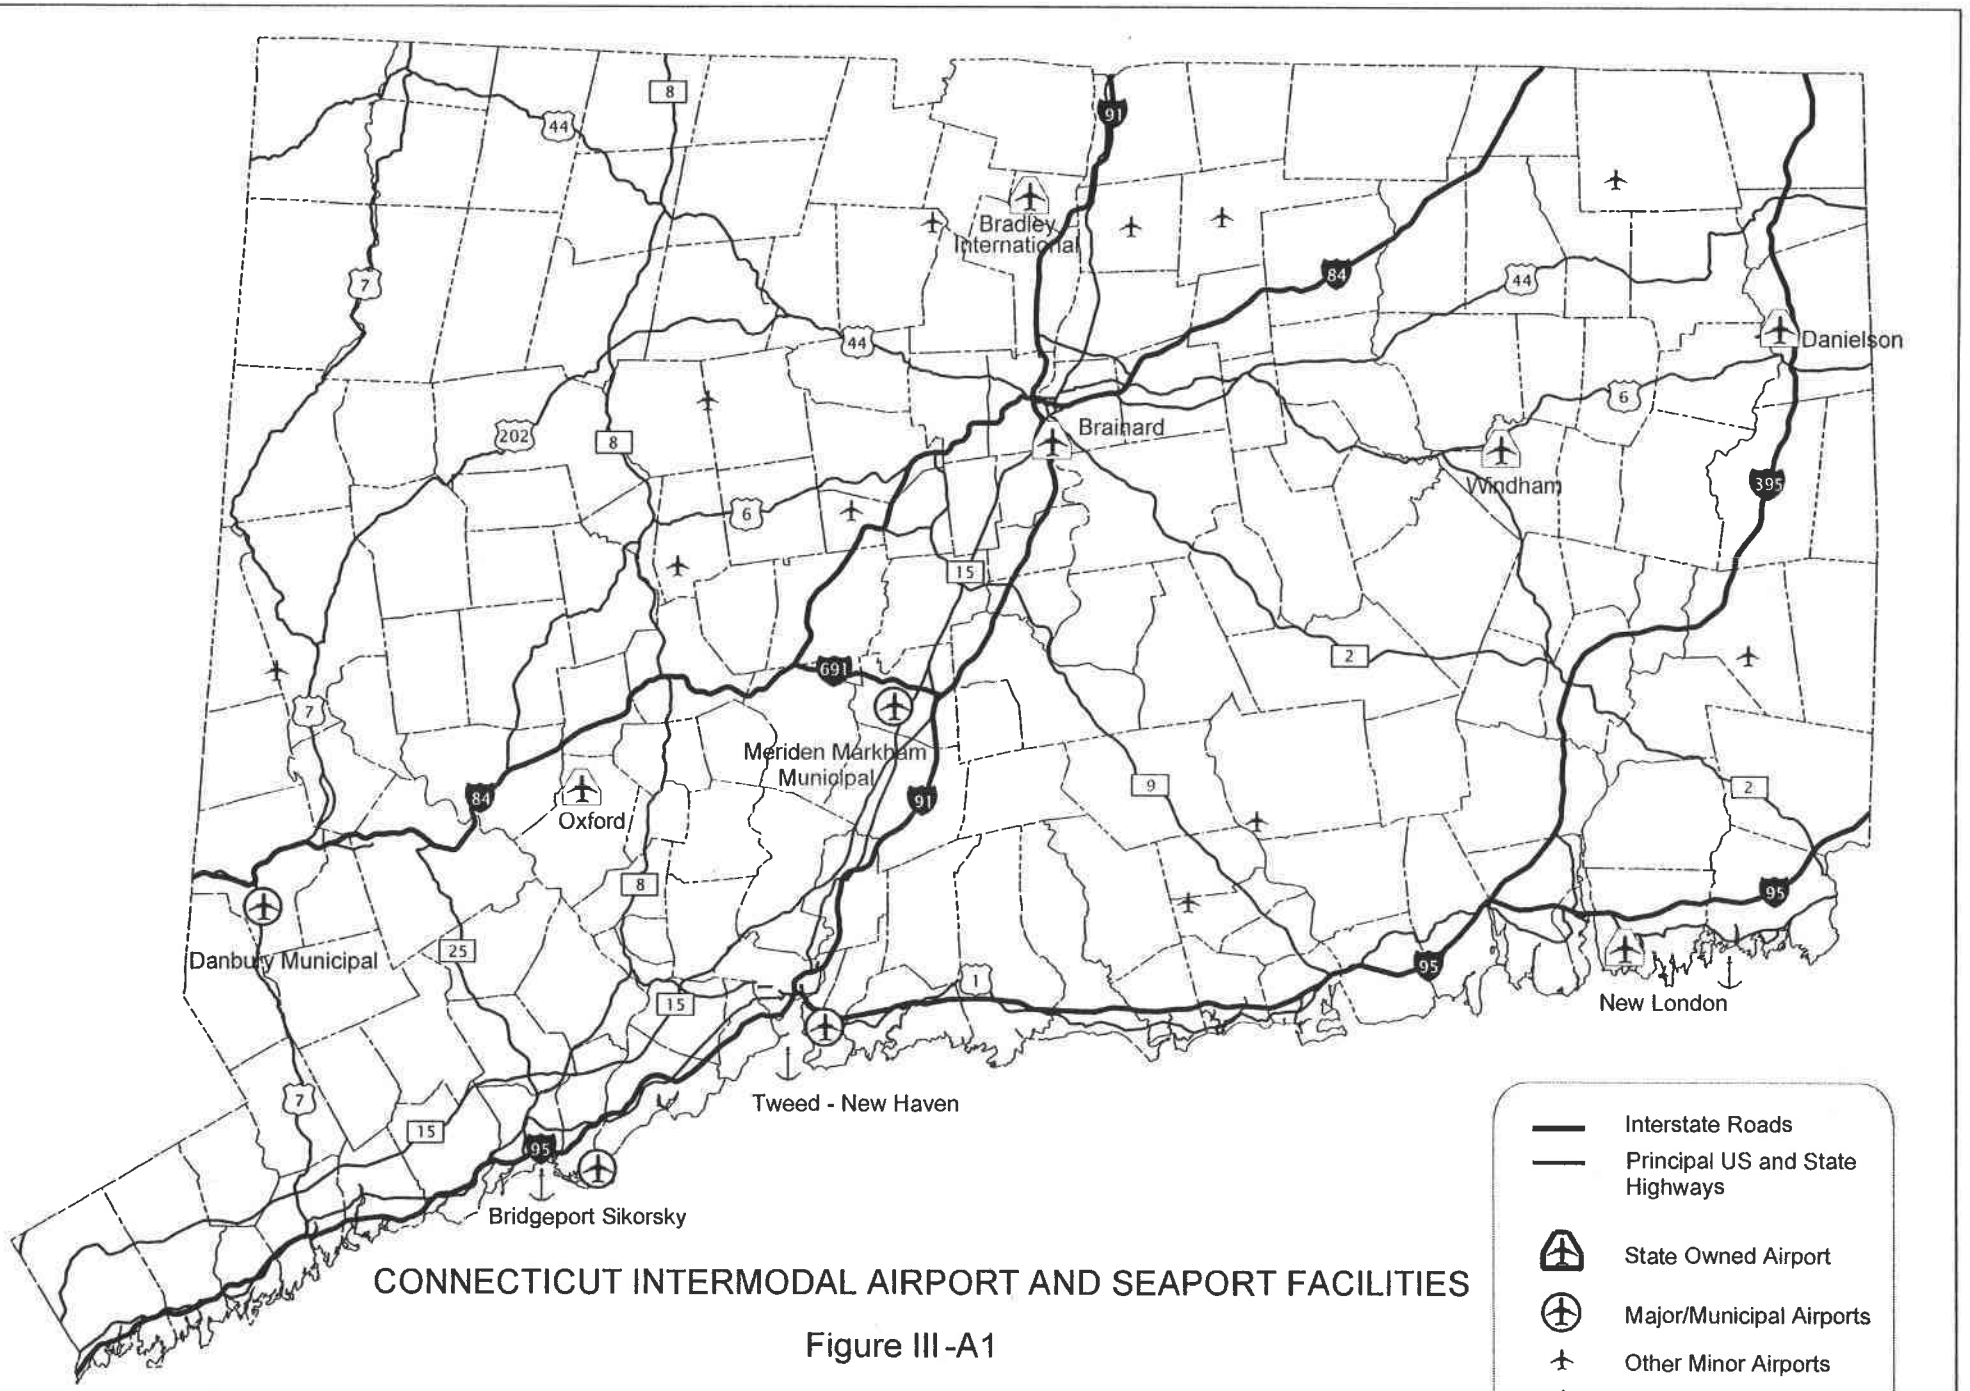
1. CONNDOT'S ROLE

The Connecticut Department of Transportation's Bureau of Aviation and Ports has a primary role in ensuring the continued growth and safety of aviation in the State. The Department's many roles include project management (overseeing projects from conception to completion) at the six state-owned airports, licensing and inspecting of all public and private airports and helipads within the state, distributing federal funding to general aviation airports for improvements and studies, and promoting economic development. The locations of the state-owned airports and the municipal and privately-owned airports in Connecticut that ConnDOT's Bureau of Aviation and Ports licenses and inspects are shown in **Figure III-A1.**

2. BRADLEY INTERNATIONAL AIRPORT (BIA)

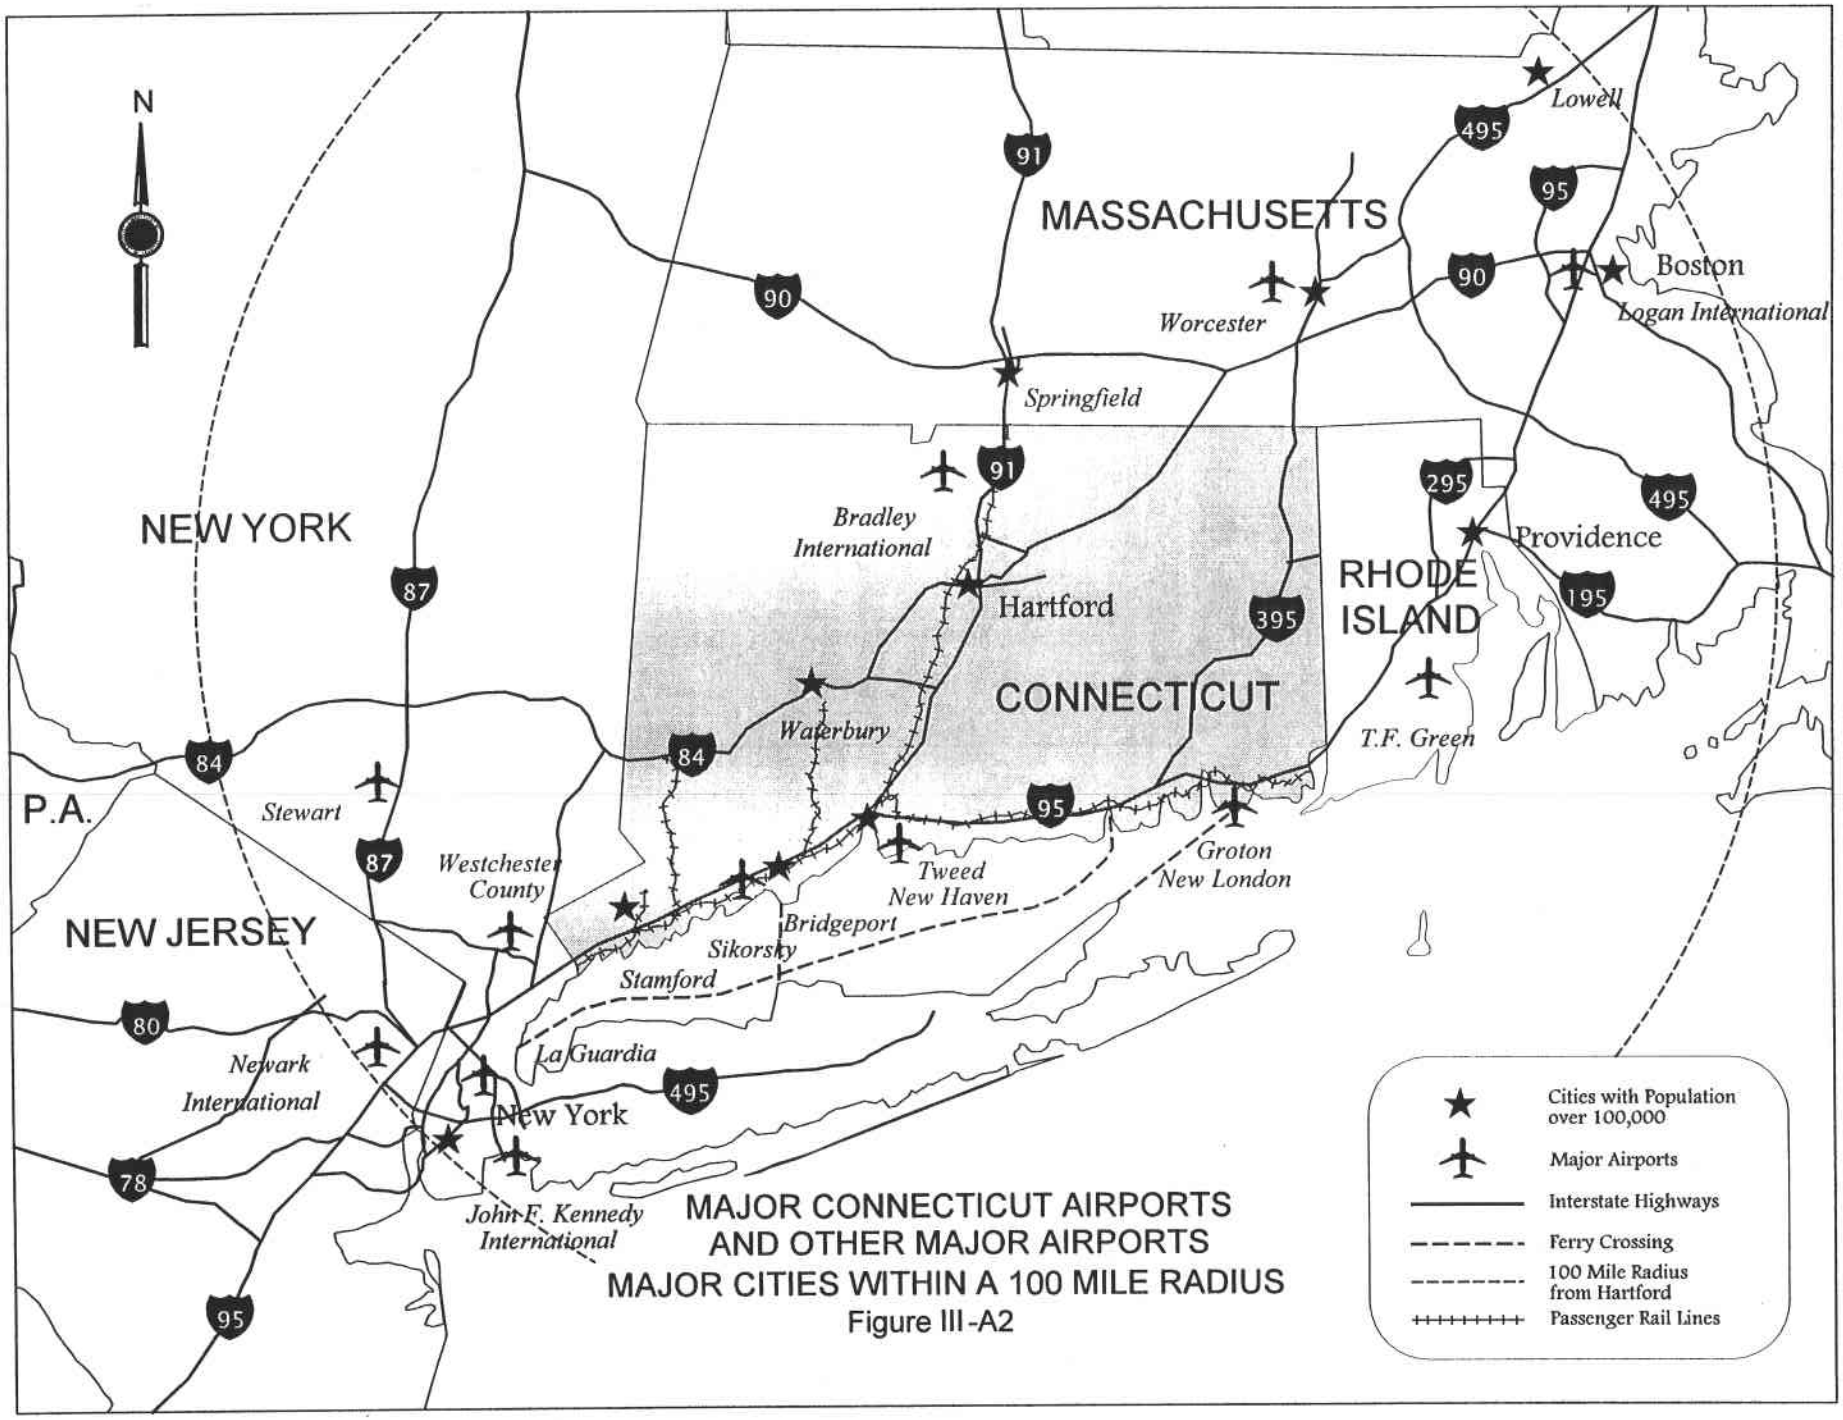
Bradley International Airport (BIA) is Connecticut's primary air carrier facility and New England's second largest airport. It presently occupies 2,358 acres of land in the towns of Windsor Locks, East Granby, Suffield, and Windsor. It is located equidistant between Hartford, Connecticut and Springfield, Massachusetts and serves over five million people in Connecticut and Western Massachusetts. BIA is a reliever airport for New York and Boston air traffic and functions as a base for both the Army and Air National Guard. Its location in relation to Logan Airport, John F. Kennedy Airport, LaGuardia Airport and other major airports and major cities within a 100 mile radius of Hartford is shown in **Figure III-A2.** Services available at BIA include scheduled, domestic air carriers, scheduled international service to Canada, scheduled commuter/regional airlines, charter flights, cargo and mail, and general aviation aircraft facilities.

The Airport is owned by the State of Connecticut, is managed by ConnDOT's Bureau of Aviation and Ports, and receives input from the Bradley Airport Commission. The Bradley Commission, whose members are appointed by State legislators and the Governor, allows the towns surrounding the Airport to comment on the operations of the Airport. BIA is operated entirely on a self-sustaining basis from revenues generated by the Airport and federal funds from the airport improvement program. No State funds are utilized to operate the Airport. Comprehensive information on the services, facilities and plans for BIA is presented in the Bradley International Airport Master Plan.



CONNECTICUT INTERMODAL AIRPORT AND SEAPORT FACILITIES

Figure III-A1



MAJOR CONNECTICUT AIRPORTS
AND OTHER MAJOR AIRPORTS
MAJOR CITIES WITHIN A 100 MILE RADIUS

Figure III-A2

a) Use

Bradley International Airport is served by most of the principal U.S. airlines and a number of regional/commuter airlines. As of August 31, 2000, the following 22 air-carrier or regional/commuter airlines were operating scheduled service at the Airport:

Air Carrier Airlines: American, America West, Continental, Delta/Delta Express, MetroJet, Midway, Midwest Express, Northwest, Southwest, TWA, United, US Airways.

Regional/Commuter Airlines: Air Nova, Air Ontario, American Eagle, Comair, Continental Express, Shuttle America, TW States, US Airways Express.

As shown in **Figure IV- A3,** in terms of total annual passenger activity, Delta led the other airlines as of August 2000 with 22.4 % of the market, followed by US Airways (22.1%), American (12.4%), Southwest (10.3%) and United 9.9%). Six other airlines (Northwest, Continental, TWA, Midway, Midwest Express and America West) accounted for 16.3% of the total annual passenger activity at the Airport. The commuter airlines as a group accounted for 6.6% of the passenger activity.

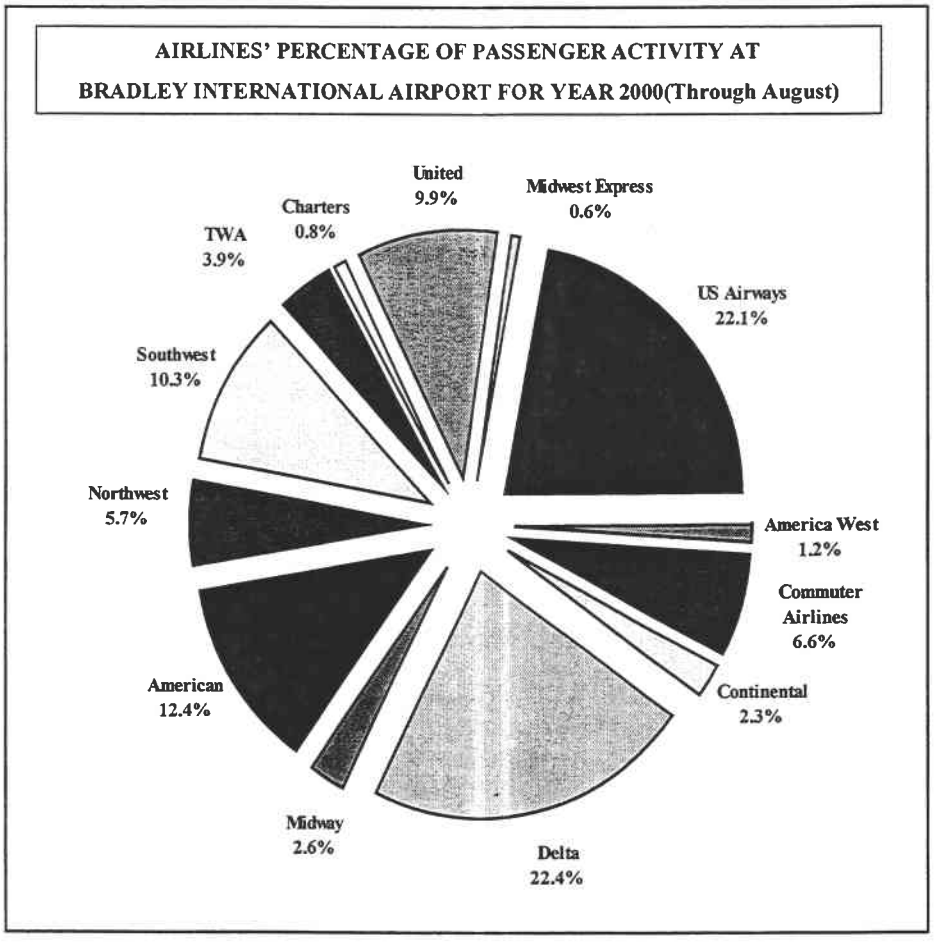


Figure III-A 3. Airlines' Percentage of Passenger Activity

Scheduled service is to U.S. destinations and Canada. Virtually all of the jet service is to hub cities of the various airlines. The cities to which jet service from Bradley was provided as of November 2000 are listed below.

Airline Cities to Which Service is Provided From BIA

American	Chicago (ORD), Dallas/Ft. Worth, Miami, San Juan
Continental	Cleveland, Newark
Delta	Atlanta, Cincinnati, Palm Beach
Delta Express	Orlando
Midway	Raleigh
Northwest	Detroit, Minneapolis
TWA	St. Louis
United	Chicago (ORD), Washington (IAD), Denver, San Francisco
US Airways	Baltimore, Charlotte, Philadelphia, Pittsburgh, Washington (DCA)
Southwest	Baltimore, Chicago, Nashville, Orlando, Las Vegas
America West	Ohio, Phoenix, Las Vegas

Commuter destinations to which service is provided from BIA include Boston, Buffalo, Montreal, Newark, New York (JFK and LGA), Rochester, Syracuse, Toronto.

Historical and projected forecasts for annual air carrier, commuter, military, and air cargo operations from 1985-2015 are presented in the following tables.

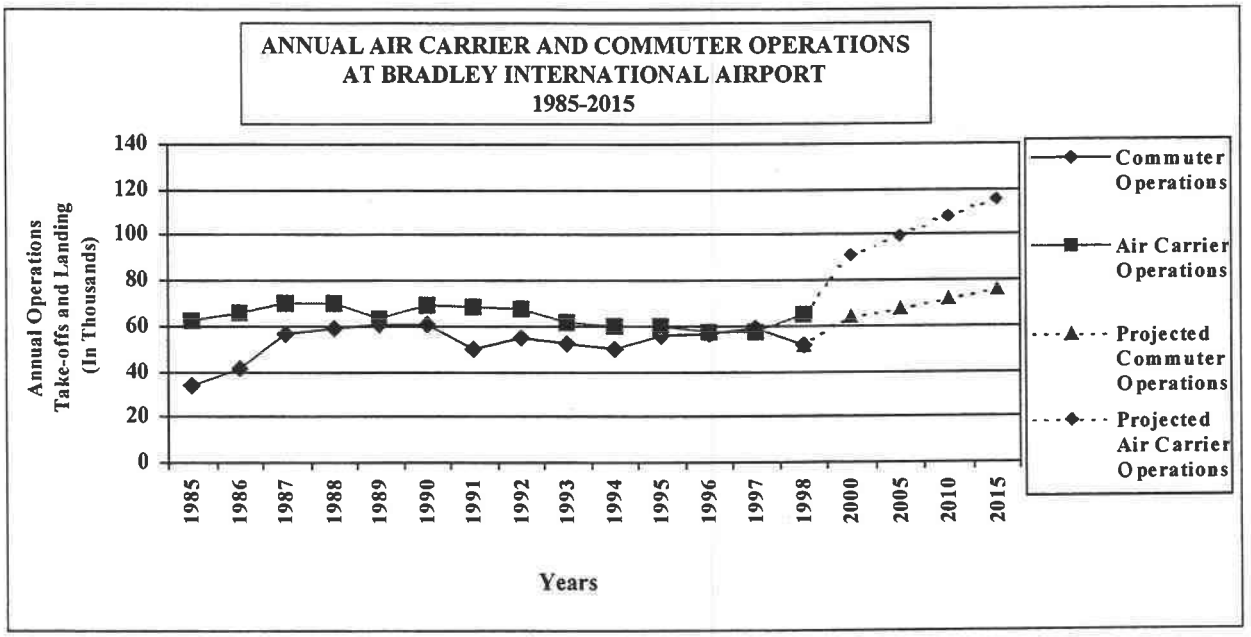

Figure III-A 4. Annual Air Carrier and Commuter Operations

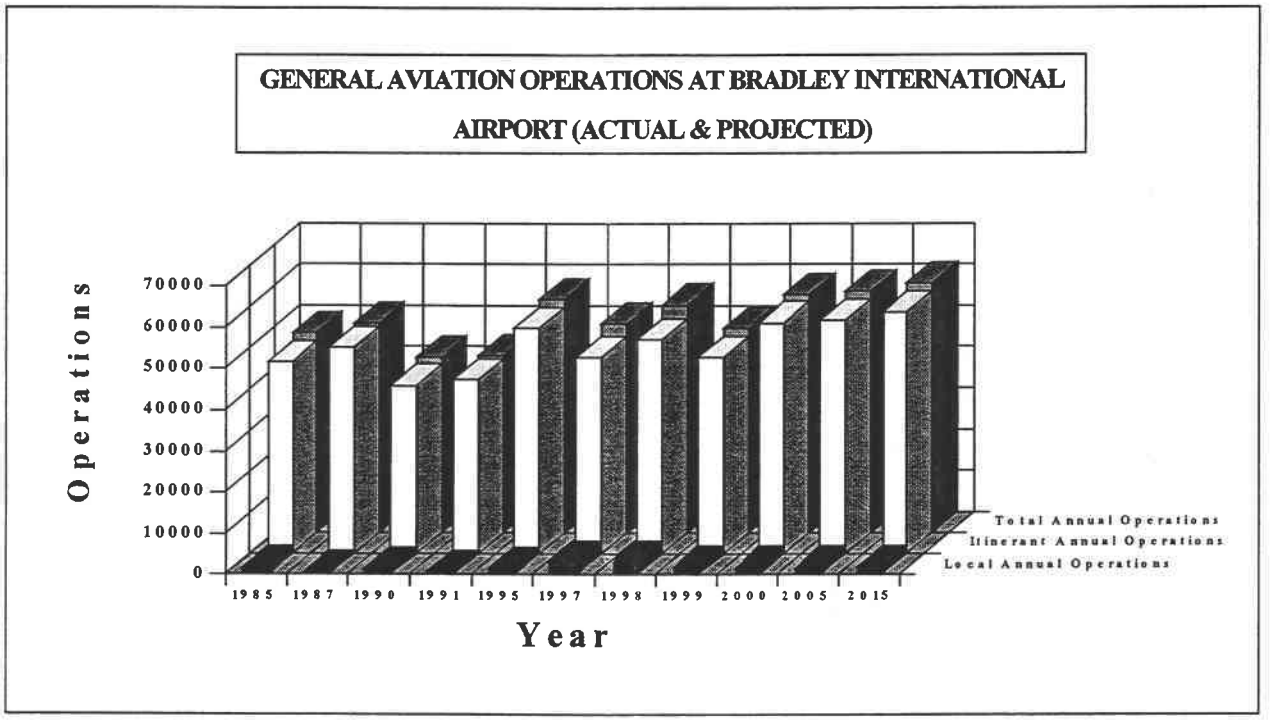

Figure III-A 5. General Aviation Operations

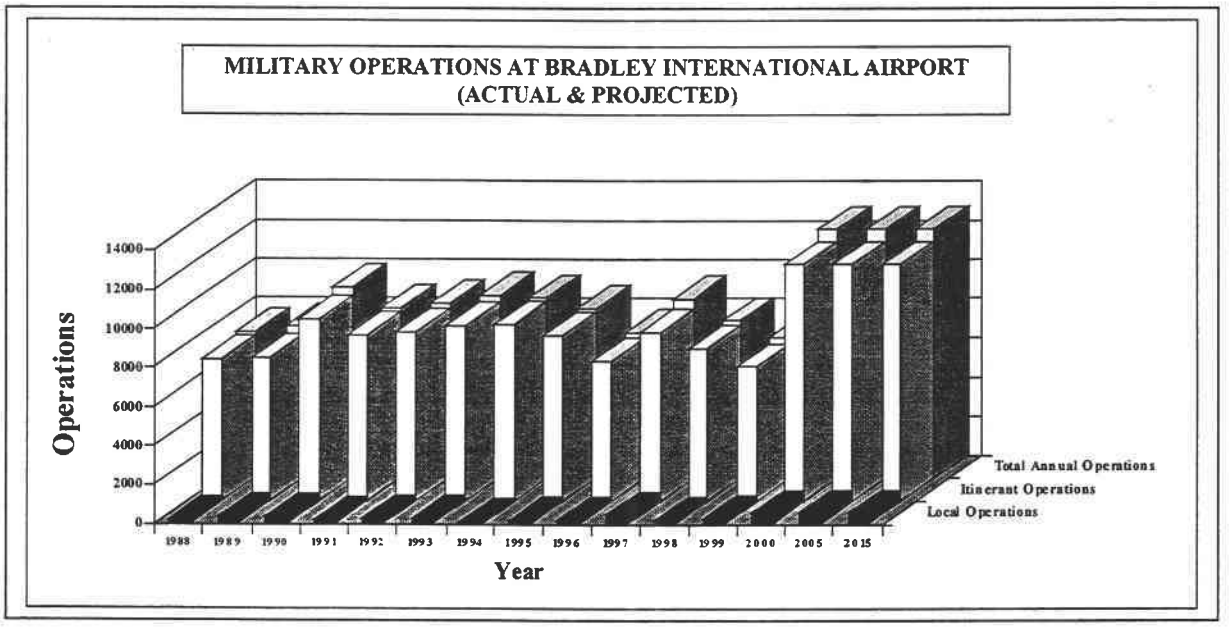

Figure III-A 6. Military Operations

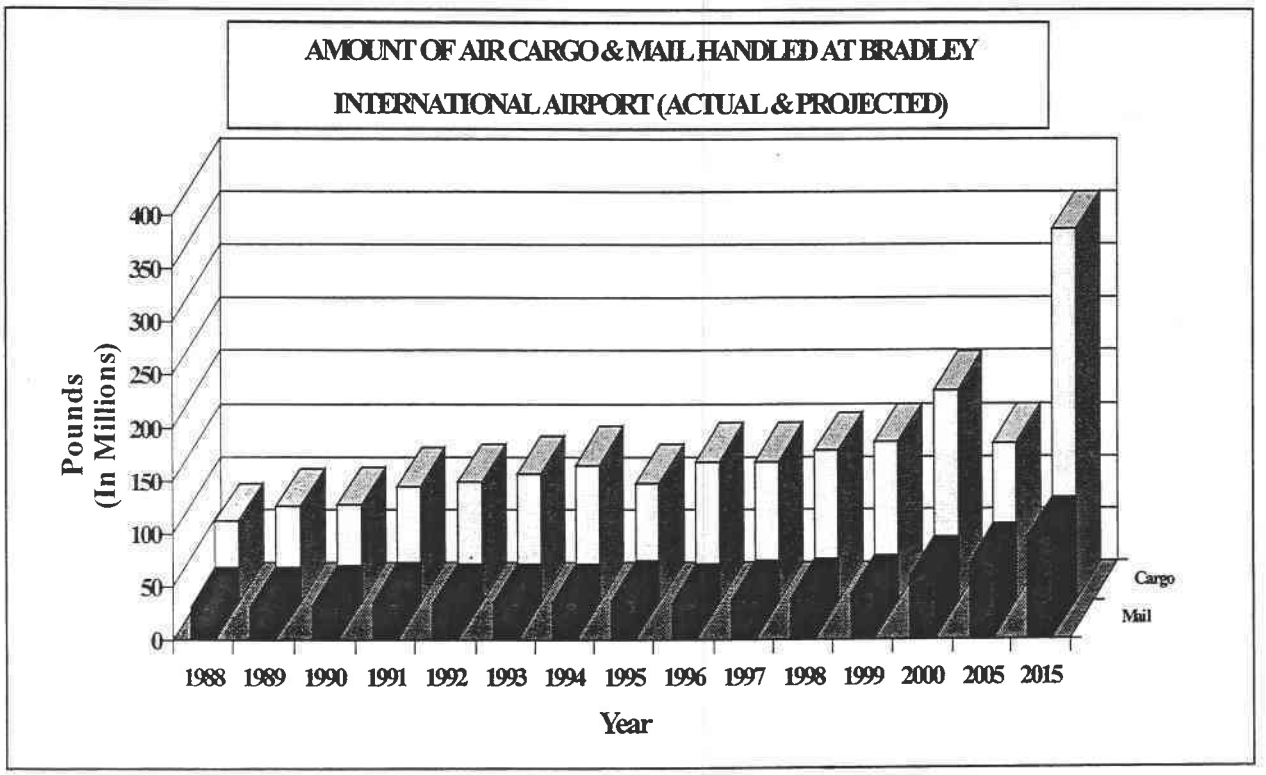

Figure III-A 7. Air Cargo and Mail

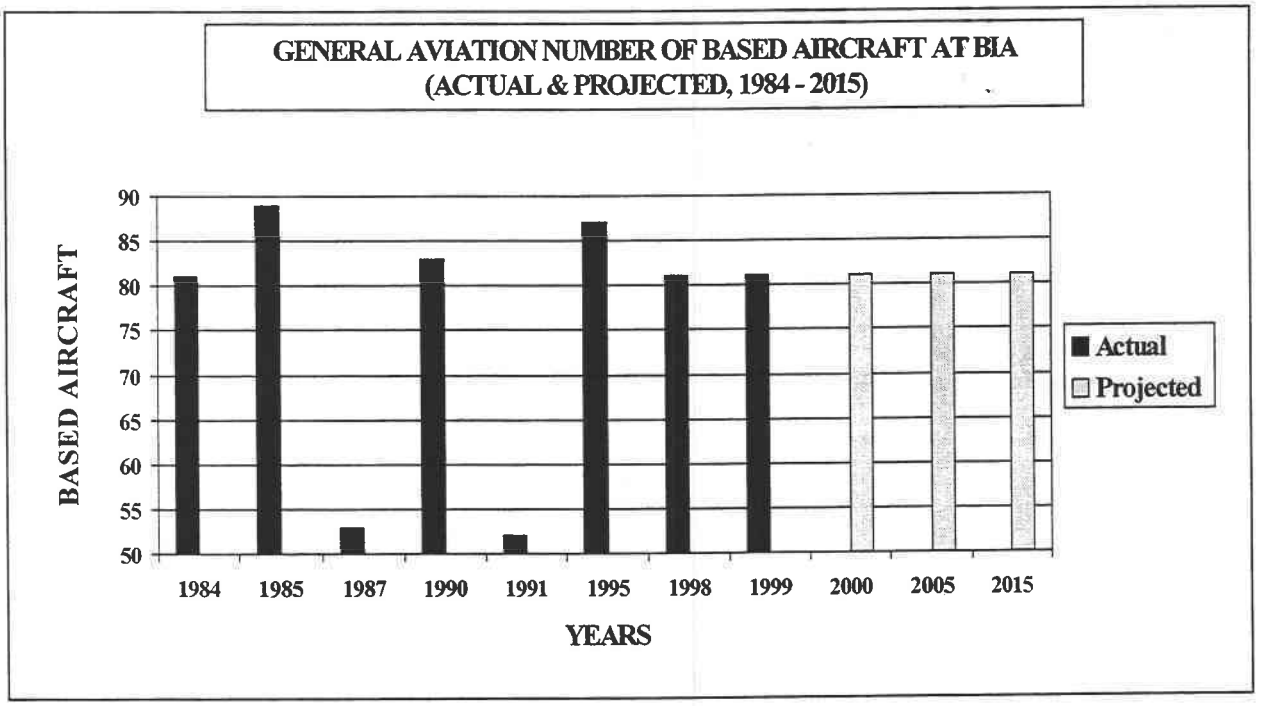

Figure III-A 8. Number of Based Aircraft

b) Existing Facilities: Airside and Landside Components

The existing facilities at BIA consist of three physical pavements with connecting taxiways and apron areas, a passenger terminal, three air-cargo complexes, a general aviation terminal, a fire rescue training facility, a maintenance facility, and two military areas belonging to the Air National Guard. These facilities and their components are discussed below.

(1) Pavement

Bradley International Airport has three runways with the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 6-24	9,502	200
Runway 15-33	6,846	150
Runway 1-19	5,141	100

These runways are serviced by a network of 16 taxiways. This network of pavement comprises an equivalent of 70 linear miles of roadway pavement.

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, the Department of Transportation's Class 1 pavement mix. The pavement condition was analyzed in a published study done by Envirodyne Corp. in 1989. This study led to an extensive pavement reconstruction program to rehabilitate all the pavements at Bradley over a five year time period. Since this pavement plan was completed, a new taxiway and aircraft aprons were constructed. The pavement condition was evaluated using existing condition plans and non-destructive testing to formulate a PCI (Pavement Condition Index) for each section of pavement. The sections were then prioritized using this rating. The final priority is used in the selection of future paving projects.

The structural life for the constructed pavement is 20 years. Bureau of Aviation and Ports' personnel are in the process of implementing a pavement analysis plan. A pavement analysis summary is presented as **Table A-I** in Appendix A.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement.
- Snow and Ice Removal. Chemicals put on the pavement slowly deteriorate the pavement and could reduce the structural life of the pavement.
- Rubber Deposits and Grooving. The runway pavements are grooved for increased drainage. Over time, rubber deposits form on runways and fill in the grooves. These rubber deposits need

to be removed by high pressure water. Over time, this can loosen stones in the pavement allowing water to saturate the pavement and cause a loss in load bearing capabilities.

- Construction Practices. It is crucial that all pavements be constructed with materials specified and in accordance with FAA specifications. The longevity of a pavement can be impacted by poor construction processes.

Ability of Runways and Taxiways to Meet Current and Future Demand. Future studies will have to be initiated and completed to determine whether the taxiways and runways are wide enough and structurally sound enough to accommodate the newer, larger, and heavier aircraft expected to be used by the airlines.

(2) Pavement Markings

Bradley International Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing project, they exhibit longevity. Markings which have been installed this way can last from three to eight years. It is anticipated that all pavement markings will be repainted within the next five years.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing and deicing chemicals greater deteriorate the pavement markings.
- Traffic. The number of aircraft and vehicles which pass over the markings affects the rate of deterioration of the pavement markings. The greater the volume of traffic, the faster the rate of deterioration.

(3) Airport Signing

Signing is an integral part of aircraft operations at Bradley International Airport. All runways and taxiways are signed in accordance with FAA Advisory Circular 150/5340-18C to insure that all aircraft are aware of their location at all times.

After the aircraft has landed, the tower controls all its movements to the gate with taxiway designations and the aircraft, in turn, use signing to follow the path.

Ability of Signs to Meet Current and Future Demands. Bradley Airport completed a project in 1992 to replace all signs to meet current FAA regulations.
The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

As of February 2000 the signs on the airport worked very well. If maintained properly, they should last many years. In the fall of 2000 Runway Guard Lights will be installed and operational to assist pilots in aircraft movements across runway 6-24.

Factors Affecting the Condition of or Demand for Signs:

- Airport Expansion. As the airport expands in the future, there will be a need to sign all new pavement improvements to meet FAA regulations.
- Weather. Snowy weather can result in a need to replace signs at airports. Signs covered by snow are sometimes hit and damaged by plows and blowers. The damaged signs must be replaced to ensure safe operations.

(4) Landing Aids

During periods of inclement weather, when the ceiling is less than 1,000 feet or the prevailing visibility is less than three miles, an airport is operating under Instrument Meteorological Conditions (IMC). IFR weather occurs about 13% of the time at Bradley International Airport.

Bradley is well equipped to accommodate aircraft operations during IFR conditions. The table below indicates the various Instrument Landing System (ILS) approaches for the runways at the airport.

ILS APPROACHES FOR RUNWAYS AT BRADLEY INTERNATIONAL AIRPORT (BIA)

RUNWAY	TYPE APPROACH	CEILING	RVR
6	CAT III B ILS	100'	600'
24	CAT I ILS	200'	1800'
15	VOR	909'	2.75 miles
33	CAT I ILS	250'	0.75 miles

Table III-A 1. ILS Approaches For Runways at Bradley International Airport

Airport lighting also serves an integral function in the daily operations at Bradley International Airport. Bradley utilizes a complex system of runway, taxiway, and approach lighting to aid aircraft in landings and departures during night and/or inclement weather operations. It is the Bureau's goal to maintain the current level of landing and lighting aids standards at the airport while studying the implementation of additional aids to more efficiently serve the public using the airlines that fly to and from Bradley International Airport.

(5) Passenger Terminal Facilities

Passenger terminal facilities include the Murphy Terminal with 13 aircraft gate positions, Terminal A with nine aircraft gate positions, and the International Arrivals Building (IAB) with three aircraft gate positions. These facilities include many amenities for the traveler, including restaurants, duty-free shopping, at-grade parking lots, shuttle service, and ground transportation to all points within Connecticut and western Massachusetts.

Condition of Terminals. Currently BIA has three passenger terminals: Murphy Terminal (built in phases during the late 1940's into the early 1950's), the International Arrivals Building (built in 1968), and Terminal A (opened in 1986). The Bureau of Aviation and Ports, through a consultant, conducted a feasibility study for the airport in 1997 using the 1993 Master Plan Study Update as a guide and reference to develop a new terminal plan. This study concluded that the Murphy Terminal should be replaced due to its age, that it did not meet current commercial airline standards, and it was too costly to entirely refurbish. The study also concluded that a need existed to construct a new terminal to the east of Terminal A. A project to construct a new terminal is currently in the beginning construction phase. The new terminal will be a state-of-the-art 260,000 square foot facility with twelve aircraft gates. The new terminal will abut Terminal A and create a unified terminal complex. The project also includes extensive renovations to Terminal A, additional hold room space on Concourse C, roadway improvements, glycol collection systems at two concourses and new passenger jetways. The Murphy Terminal, a.k.a. Terminal B, will be closed to the public, except for a small portion on the east side. This portion along with Concourse B and the IAB will operate separately from the unified terminal facility. Further detailed information on this plan is presented in Section IV.

The International Arrivals Building (IAB) and Terminal A will undergo extensive renovations under the new terminal project to modernize and increase operational efficiency.

(6) Air Freight Facilities

Currently Bradley has three cargo complexes: the Roncari Freight Facility, USAirports, and the UPS Air Express Sorting Hub. The Roncari Freight Facility was constructed in 1984, the USAirports facility was constructed in 1992, and the UPS building was completed in 1997. These facilities are in excellent condition.

Ability of Freight Facilities to Meet Current and Future Demand. Based on forecasts of demand for air cargo buildings and all-cargo aircraft parking aprons, a significant increase in cargo facilities will be required. On-airport cargo facility development should emphasize apron areas for all-cargo aircraft and cargo buildings which take advantage of direct access to these apron areas. Other air cargo buildings may be located off-airport, as certain existing operators have chosen to do, when the functional requirements allow.

One potential area is north of Runway 15-33 adjacent to the new ATCT and fire school. This site (of 20-30 acres) would have airfield access from Taxiway J, but its usable area is limited by the restricted area associated with the VORTAC. Landside access would also require roadway improvements. Another area is opposite the US Airports facility east of Runway 15.

Two other possible areas have been identified as suitable for possible air cargo facility development. One area includes approximately 30 acres north of the Canadair hangar along Taxiway E, and extending east to the Army National Guard facility. Also, in this same general area is a parcel east of the Business Express hangar of approximately 5 acres which could be used for belly freight cargo facilities.

The aforementioned areas are estimated to have sufficient capacity to meet the forecast needs of the airport through the planning period of 2015.
During 1998 Bureau of Aviation and Ports has been negotiating with developers to construct new freight facilities at the airport. The ability of the airport to meet the future air cargo demands will rely on the construction of these new freight facilities.

(7) General Aviation (GA) Facilities

Bradley International Airport plays an important role in general aviation in Connecticut. It has two fixed base operators, TACAIR and Signature Flight Support, as well as private facilities for corporate aircraft for companies based in the greater Hartford area. These GA facilities include storage and maintenance hangars, aircraft aprons for based and transient aircraft, and GA terminal facilities. The present GA terminal facilities are in good condition and of adequate size to serve anticipated levels of activity.

Ability of GA Facilities to Accommodate Current and Future Demand. Since the airport has had close to 90 based aircraft in the past without any additional hangar or apron facilities, it is expected that forecasted based aircraft can be accommodated with a minimum of additional facilities. One change in GA, however, may be to provide additional hangar space for based aircraft. This is predicated on the based aircraft forecast which projects an increase in size and value of these aircraft. Additional private corporate hangars are expected to account for the increase in hangar capacity.

(8) Air Operations Facilities

The Federal Aviation Administration (FAA) which controls all air operations, operates a 24-hour air traffic control tower and a terminal radar approach and departure center at the airport. A new, state-of-the-art control tower was recently constructed on the west side of the airport and is now fully operational.

(9) Parking at Bradley International Airport

Surface parking is provided on-airport for passengers, visitors, and employees. On-airport parking consists of Short-Term Parking Lot B; Long-Term Parking Lots 1, 2, 3, 4, 5A, 5B and 6 (with shuttle service); and an employee parking lot (also with shuttle service). The total number of spaces available in each lot, including handicap spaces, is indicated in **Table IV-2**.

The short and long-term lots are both revenue-generating and are privately managed, under contract with ConnDOT, by APCOA, Inc. In addition to on-airport parking, 11 privately-owned off-airport parking lots operate "valet" parking services using shuttle vans to the terminals.

PARKING SPACES AT BRADLEY INTERNATIONAL AIRPORT		
Type of Parking	Handicap Spaces	Total
Short Term	20	780
Long Term		
1	11	520
2	8	522
3	18	728
4	6	457
5A	8	377
5B	12	572
6	12	360
Employee Lot	20	830

Table III-A 2. Parking Spaces at Bradley International Airport

Ability of Parking Facilities to Meet Future Demands. Additional on-airport parking will be required to meet future demand, given the steady growth of enplanements and deplanements over the last several years, the projected continuation of these growth trends and the construction of the new terminal building improvement program.

To meet the expected demand for the immediate future, the Bureau of Aviation and Ports advertised through a request for proposals (RFP) for a design/build/operate parking garage facility. Negotiations have been concluded with the preferred developer and the garage is currently under construction with 1,700 spaces to be available in May 2001 and the full completion by December 2001 when a total of 3,453 spaces, both long and short term, will be available. In advance of the start of the garage construction, ConnDOT constructed two new long term parking lots (Lots 5A & 5B) along Route 75 (at Light Lane Road) to accommodate 949 vehicles, including twenty handicap spaces. These lots feature bus shelters with scheduled shuttle service to and from all terminals. A new employee lot containing 800 spaces was also constructed in this area and it opened for use in early summer of 2000.

c) Ability of Bradley International Airport to Meet Current and Future Demands

The ability to meet the future aviation demands at Bradley International Airport will become increasingly challenging to ensure the continued level of service at the airport. Some key factors that will effect the ability of the airport to meet the current and future aviation demands are increasing air traffic, the introduction of larger aircraft, environmental awareness and new regulations, new and improved navigational aids, funding and the airport's need to grow. These factors and their effect on the airport are discussed below.

Increased Air Traffic. Over the next twenty years experts predict that all air traffic operations will increase at a very rapid pace (**see Figure III-A4, Annual Air Carrier Operations**). Airports will be hard pressed to ensure the safety of the flying public without a clear, concise plan to meet such increases in traffic. Bradley International Airport has recognized this need and has taken action to implement such a plan.

Murphy Terminal, which is functionally obsolete and becoming too costly to refurbish, will be closed for use by domestic airline carriers. A small section of the Terminal and Concourse B will be retained for use by regional carriers and TWA Airlines. A new terminal will be constructed adjacent to Terminal A thereby creating a unified terminal with 23 gates. The new terminal and concourse will be a state-of-the-art 260,000 square foot facility with twelve aircraft gates. Construction of this project began in June 2000 and will be completed in October 2002. Renovations to Terminal A and Concourse C will be undertaken to blend with the new terminal and improve passenger services including ticketing, security check through, baggage claim, concessions, etc. Six major domestic airlines will operate from the unified terminal. The Federal Inspection Service (FIS) located in the IAB will be relocated to a new facility being constructed south of Concourse A. The vacated area in the IAB will be leased to Southwest Airlines for their expansion plans. A multi-level parking structure is being built in front of the unified terminal to increase parking capacity within walking distance to this terminal. Section IV contains a complete description of the Bradley Improvement Program.

Subsequent projects directly associated with the new terminal project will increase the efficiency of passengers using the airport. To increase the number of aircraft gates, additions will be constructed onto Terminal A and the International Arrivals Building to allow a larger number of aircraft to enplane/deplane concurrently. Improvements are scheduled to Route 20 and Schoephoester Road including a proposed fly over to Terminal Road alleviating stop and go traffic at that entrance. A multi-level parking structure is being built in front of Terminal A to increase parking capacity within walking distance to all terminals.

Larger Aircraft. The current industry trend has been for airlines to replace their aging fleets of aircraft with new, larger and more efficient aircraft. It has been forecasted that air carriers will be utilizing larger aircraft like the new Boeing-777 more frequently. These new aircraft have different design standards for airport facilities than the current aircraft being flown. Old terminals throughout the country will have to be refurbished and renovated to meet these new standards or new terminals will have to be built. Future studies will have to be initiated and completed to determine whether the taxiways and runways are wide enough and structurally sound enough to accommodate the newer, larger, and heavier aircraft expected to be used by the airlines. Proper planning will be required to enable Bradley International Airport to meet these future demands. The new terminal and renovations to the existing terminals will accommodate the air carriers serving the airport.

Environmental Concerns. New environmental regulations and mandates will need to be addressed as to their impact on expansion and continual operation of the Airport. A major environmental concern at the airport has been the deicing of aircraft during inclement weather operations. Runoff from the areas where the aircraft were being deiced was slowly leaching into the watershed that

surrounded the southern part of the terminal complex. To address this problem the Airport is constructing a Remote Deicing Facility (RDF) where aircraft will be deiced in one location immediately prior to takeoff. This RDF is comprised of an apron that will ultimately allow five Boeing-757 type aircraft to be deiced simultaneously. The RDF will have a closed drainage system that will collect the byproduct of the deicing procedure and store it in underground holding tanks. The RDF facility will be completed in the fall of 2000.

Other environmental concerns facing the Airport include clearing and developing areas within inland wetlands, endangered bird species nesting at the airport, and noise pollution from arriving and departing aircraft.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

3. HARTFORD-BRAINARD AIRPORT

Hartford-Brainard Airport presently occupies 206.5 acres of land located approximately two miles southeast of downtown Hartford along the western bank of the Connecticut River. It is classified by the Federal Aviation (FAA), in its National Plan of Integrated Airport Systems (NPIAS), as a reliever airport for Bradley International Airport in Windsor Locks. The Airport is home to the Air National Guard and one FBO, Million Air, who provides air taxi service and services for general aviation aircraft.

The Airport is owned by the State of Connecticut and is currently operated by ConnDOT's Bureau of Aviation and Ports. It receives funding from the State's General Transportation Fund and federal assistance from the Federal Aviation Administration (FAA). Comprehensive information on the services, facilities, and plans for Hartford-Brainard Airport is presented in the Hartford-Brainard Airport Master Plan.

a) Use

Although Hartford-Brainard Airport is classified as a reliever airport for Bradley International Airport, it is utilized to a great extent for general aviation, with 133 based aircraft. Military and air taxi operations account for the remaining operations. Listed below are the number of operations at the Airport during a 12-month period from 1998-1999. This information was taken from the FAA's Airport Master Record, Form 5010.

OPERATIONS AT HARTFORD-BRAINARD AIRPORT		
Type of Operation	No. of Operations	% Total Operations
Air Carrier	0	0.0%
Commuter	0	0.0%
Air Taxi	1,673	1.1%
GA Local	56,042	42.8%
GA Itinerate	80,558	56.0%
Military	426	0.1%
Total	108,780	100.0%

Table III-A 3. Operations at Hartford-Brainard Airport

b) Existing Facilities

The existing facilities at Hartford-Brainard Airport consist of two physical pavements with connecting taxiways and apron areas, one turf runway, a general aviation terminal, an administration building, a fire rescue and maintenance facility, an FAA control tower, and a military area belonging to the Air National Guard. These facilities and their components are discussed below.

(1) Pavement

Hartford-Brainard Airport has three runways with the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 2-20	4,418	150
Runway 11-29	2,315	70
Turf (NE/SW)	2,350	150

These runways are serviced by a network of nine taxiways.

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, ConnDOT's class 1 pavement mix. The pavement conditions at the airport were analyzed in February 1995 by engineers at the Bureau of Aviation and Ports and summarized in a Pavement Management Plan. A copy of this plan is on file at the Airport. Since the completion of the Pavement Management Plan, Taxiway "A" has been rehabilitated. Runway 11-29 and Taxiways A, B, V, and J have been rehabilitated.

The structural life for the constructed pavements is 20 years. Bureau of Aviation and Ports' personnel are continually re-evaluating the Airport's pavements to implement future pavement improvement programs.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement.

- Snow and Ice Removal. Chemicals put on the pavement slowly deteriorate the pavement and could reduce the structural life of the pavement.

- Rubber Deposits and Grooving. The runway pavements are grooved for increased drainage. Over time rubber deposits form on runways and fill in the grooves. These deposits then need to be removed by high pressure water. Over time, this can loosen stones in the pavement allowing water to saturate the pavement and cause a loss in load bearing capabilities.

- Construction Practices. It is crucial that all pavements be constructed with materials specified and in accordance with FAA specifications. The longevity of a pavement can be impacted by poor construction processes.

(2) Pavement Markings

Hartford-Brainard Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-1H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing project, they exhibit longevity. Markings which have been installed this way can last from three to eight years. It is anticipated that all pavement markings will be repainted within the next five years.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing and deicing chemicals deteriorate the pavement markings.
- Traffic. The number of aircraft and vehicles that pass over the markings affects the rate of deterioration of the pavement markers. The greater the volume of traffic the faster the deterioration.

(3) Airport Signing

Signing is an integral part of aircraft operations at Hartford-Brainard Airport. All runways and taxiways are signed in accordance with FAA Advisory Circular 150/5340-18C to insure all aircraft are aware of their location at all times.

After the aircraft has landed, the tower controls all its movements to the aircraft apron with taxiway designations and the aircraft, in turn, use signing to follow the path.

Ability of Signs to Meet Current and Future Demands. Brainard Airport completed a project in 1992 to replace all signs to meet current FAA regulations.

The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

As of February 2000 the signs on the airport work very well and if maintained properly, should last many years.

Factors Affecting the Condition of or Demand for Signs:

- Rehabilitation of Pavement. There will be a need to re-sign all new pavement to meet FAA regulations as the airport rehabilitates pavements that have come to the end of their useful design life.
- Winter Weather. Signs covered by snow are sometimes hit by plows and blowers and then must be replaced to ensure safe airport operations.

(4) Landing Aids

During periods of inclement weather, when the vertical visibility (ceiling) is less than 1000 feet or forward visibility (RVR - Runway Visual Range) is less than three miles, an airport is operating under Instrument Flight Rule (IFR) conditions. IFR weather occurs about 13% of the time at Hartford-Brainard Airport.

Brainard Airport has only one runway equipped to accommodate aircraft operations during IFR conditions. The table below indicates the various Instrument approaches for Runway 2 at the airport.

INSTRUMENT APPROACHES FOR RUNWAYS AT HARTFORD-BRAINARD AIRPORT

RUNWAY	TYPE APPROACHES
2	LDA, NDB, GPS
20	NONE
11	NONE
29	NONE

Table III-A 4. Instrument Approaches for Runways at Hartford-Brainard Airport

Airport lighting also serves an integral function in the daily operations at Hartford-Brainard Airport. Brainard utilizes a complex system of runway, taxiway, and approach lighting to aid aircraft in landings and departures during night and/or inclement weather operations. It is the Bureau's goal to maintain the current level of landing and lighting aids standards at the airport while studying the implementation of additional aids to more efficiently serve the public using the airport.

(5) General Aviation (GA) Facilities

Hartford-Brainard Airport plays an important role in General Aviation in Connecticut. It has one fixed base operator, Million Air, who provides storage and maintenance facilities, an aircraft apron for based and transient aircraft, and GA terminal facilities. The present GA facilities also include three t-hangars which provide storage area for additional based aircraft. The State presently is involved in negotiations to lease these t-hangars to a private second party. The GA facilities are in good condition and the existing t-hangars were rehabilitated in the summer/fall of 1998. The facilities are of adequate size to serve the anticipated level of service in the future. Currently the airport has 133 based aircraft and if the need arises, the second party leasing the t-hangars has an agreement with the State to build an additional three more adjacent to the existing t-hangars.

(6) Air Operations Facilities

The Federal Aviation Administration (FAA), which controls air operations, operates an 18-hour air traffic control tower. The tower is equipped and staffed to provide VFR (Visual Flight Rule) separation of arriving and departing aircraft and separation of aircraft on the ground at aircraft movement areas, i.e. runways and taxiways. IFR operations are handled by Bradley International Airport's FAA control tower.

c) Ability of Airport to Meet Current and Future Demands

The ability to meet the future aviation demands at Hartford-Brainard Airport will become increasingly challenging to ensure the continued level of service at the Airport. Some key factors that will affect the ability of the Airport to meet the current and future aviation demands are new environmental concerns and regulations, new and improved navigational aids, funding, and runway safety improvements. These factors and their effect on the Airport are discussed below.

Environmental Concerns. New environmental regulations and mandates will need to be addressed as to their impact on safety area improvements and to the continual operation of the Airport. An ongoing concern at the airport are trees penetrating the Federal Aviation Regulations (FAR) Part 77 imaginary flight surfaces. These imaginary surfaces rise from the Airport's runway environment at certain slopes, based on the type of approach, and should be clear of all obstructions. Currently trees penetrate some approach and some transitional surfaces at the airport. Most of the penetrations are trees growing in the Connecticut River flood plain. The removal of these trees will require permits from the Connecticut DEP, the Army Corps of Engineers, and local coordination with city officials and the public. These activities are an ongoing process by the Bureau of Aviation and Ports. Another concern will be the ability of the Airport to improve and expand the runway safety areas. These improvements will enhance the safety of the general public using the airport's facilities. The Airport will need to acquire land rights from the Metropolitan District Commission

(MDC) and will need to acquire permits from the Connecticut DEP and the Army Corps of Engineers to fill and grade within regulated wetlands.

New and Improved Navigational Aids. The Airport will need to address updating the current navigational aids to be able to meet the future demands that may be placed on the airport due to increased corporate jet traffic. To meet this demand, the Airport now has a GPS approach for runway 2 and has requested one for runway 20. The Airport may experience additional corporate service by implementing these navigational aids which may lower the approach minimums and allow more traffic that currently gets diverted to Bradley International Airport in inclement weather to land at Hartford-Brainard Airport.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

4. GROTON-NEW LONDON AIRPORT

Groton-New London Airport is one of six State-owned airports. It occupies approximately 407 acres in southeastern Connecticut in the Town of Groton. It lies along the Long Island Sound coastline at the inlet of the Poquonnock River. It is located 89 air miles southwest of Boston, 53 miles southeast of Hartford/Springfield and 108 miles northeast of New York. It is classified in the FAA's National Plan of Integrated Systems as a commercial service-primary airport. Its role is categorized as a short-haul airport, providing commercial service to destinations of up to 500 miles.

The Airport is currently operated by ConnDOT's Bureau of Aviation and Ports. It receives funding from the State's General Transportation Fund and federal assistance from the FAA. Comprehensive information on the services, facilities, and plans for the airport is presented in the Groton-New London Airport Master Plan.

a) Use

Groton-New London Airport is used mostly for general aviation, military, and air taxi, with one major airline, USAirways Express operating four roundtrip flights daily. Listed below are the number of operations at the airport for calendar year 1999.

OPERATIONS AT GROTON-NEW LONDON AIRPORT- 1999		
Type of Operation	No. of Operations	% Total Operations
Air Carrier	4,756	5.92%
General Aviation	71,256	88.72%
Military	4,307	5.36%
Total	108,780	100.00%

Table III-A 5. Operations at Groton-New London Airport- 1999

b) Existing Facilities: Airside and Landside Components

The existing facilities at Groton-New London Airport consist of two paved and one water runway with connecting taxiways, apron areas, a terminal building with administration offices, a fire/rescue building and a maintenance building. The military presence at the airport is the Connecticut Aviation Classification Repair Activity Depot (CT-AVCRAD) operated by the Connecticut Army National Guard. These facilities and their components are discussed below.

(1) Pavement

Groton-New London Airport has two runways: Runway 5-23 and Runway 15-33. A third paved runway, Runway 10-28, was closed in 1986. In addition to the paved runways, there is also a water lane established on the Poquonnock River to serve seaplanes (Runway 5W-23W). The three runways have the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 5-23	5,000	150
Runway 15-33	4,000	150
Runway 5W-23W	3,000	300

These runways are serviced by a network of seven taxiways.

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, ConnDOT's class 1 pavement mix. The pavement conditions at the Airport were analyzed in July 1995 by engineers at the Bureau of Aviation and Ports and summarized in a Pavement Management Plan. A copy of this plan is on file at the Airport. Since the completion of the Pavement Management Plan, Runway 5-23 has been rehabilitated and Runway 15-33 has been scheduled to be rehabilitated in 2001.

The structural life for the constructed pavements is 20 years. Bureau of Aviation and Ports' personnel are continually re-evaluating the Airport's pavements to implement future pavement improvement programs.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement.
- Snow, Ice, and Shell Removal. Chemicals put on the pavement slowly deteriorate the pavement and could reduce the structural life of the pavement. Due to the Airport's

geographical location, seagulls drop shells on the pavement, requiring the runways to be plowed or broomed daily. This slowly deteriorates the structural integrity of the pavement.

- Rubber Deposits and Grooving. Runway 5-23 pavements are grooved for increased drainage. Over time, rubber deposits form on runways and fill in the grooves. The deposits then need to be removed by high pressure water. Over time, this can loosen stones in the pavement allowing water to saturate the pavement and cause a loss in load bearing capabilities.
- Construction Practices. It is crucial that all pavements be constructed with materials specified and in accordance with FAA specifications. The longevity of a pavement can be impacted by poor construction processes.

(2) Pavement Markings

Groton-New London Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-1H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing project, they exhibit longevity. Markings which have been installed this way can last from three to eight years.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing and deicing chemicals deteriorate the pavement markings. Conditions that necessitate frequent plowing and deicing at the airport increase the rate of deterioration of the pavement markings.
- Traffic. The number of aircraft and vehicles that pass over the markings affects the rate of deterioration of the pavement. The greater the volume of traffic the faster the rate of deterioration.

(3) Airport Signing

Signing is an integral part of aircraft operations at Groton-New London Airport. All runways and taxiways are signed in accordance with FAA Advisory Circular 150/5340-18C to insure all aircraft are aware of their location at all times.

After the aircraft has landed, the tower controls all its movements to the aircraft apron with taxiway designations and the aircraft, in turn, use signing to follow the path.

Ability of Signs to Meet Current and Future Demands. Groton-New London Airport completed a project in 1993 to replace all signs to meet current FAA regulations.

The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

As of August 2000 the signs on the airport worked well and, if maintained properly, should last many years.

Factors Affecting the Condition of or Demand for Signs:

- Rehabilitation of Pavement. There will be a need to re-sign all new pavement to meet FAA regulations as the Airport rehabilitates pavements that have come to the end of their useful design life.
- Winter Weather. Signs that become covered by snow are sometimes hit by plows and blowers and then must be replaced to ensure safe airport operations.

(4) Landing Aids

During periods of inclement weather, when the vertical visibility (ceiling) is less than 1,000 feet or forward visibility (RVR - Runway Visual Range) is less than three miles, an airport is operating under Instrument Flight Rule (IFR) conditions. IFR weather occurs about 30% of the time at Groton-New London Airport.

Groton-New London Airport has only one runway equipped to accommodate aircraft operations during IFR conditions. **Table III-A-4** indicates the various Instrument approaches for runways at the airport.

Airport lighting also serves an integral function in the daily operations at Groton-New London Airport. Groton utilizes a complex system of runway, taxiway, and approach lighting to aid aircraft in landings and departures during night and/or inclement weather operations. It is the Bureau's goal to maintain the current level of landing and lighting aids standards at the Airport while studying the implementation of additional aids to more efficiently serve the public utilizing the Airport.

INSTRUMENT APPROACHES FOR RUNWAYS AT GROTON-NEW LONDON AIRPORT

RUNWAY	TYPE APPROACHES
5	VOR, GPS, ILS
23	VOR, GPS
15	NONE
33	GPS

Table III-A 6. Instrument Approaches for Runways at Groton-New London Airport

(5) Passenger Terminal Facilities

The passenger terminal facility was originally constructed in 1963 and is structurally sound. The terminal was renovated in 1997. The renovations included a new roof, a new heating and ventilation air conditioning system, Americans with Disabilities Act (ADA) compliance, new carpeting, and other improvements. The building has an area of 10,593 square feet and houses the commuter and charter airlines, rental car offices, a flight school, and a restaurant.

(6) General Aviation (GA) Facilities

There is presently one fixed-base operator located at Groton. Columbia Air Services, located north of the terminal building, provides aircraft services, aircraft sales, maintenance, and fueling services. As the only fuel provider on the field, Columbia services airlines, general aviation, and the Connecticut Army Guard. Columbia's facilities consist of two 15,000 square foot conventional hangars used mainly for aircraft maintenance, combined office space that comprises approximately 9,750 square feet. Parking for 76 automobiles is available adjacent to the hangars. An above ground fuel storage facility is located northwest of the new hangar on Tower Avenue. The facility meets current federal tank construction requirements, is housed in its own building, and provides storage for 20,000 gallons of Jet-A fuel and 12,000 gallons of 100 low-lead aviation gasoline. A new multiple services operator, Lanmar Marine and Aviation, Inc., with a main focus on helicopter-related activities, is scheduled to begin construction in the fall of 2000. In addition, a new FBO, Anchor Air, is scheduled to begin construction of a new facility in the spring of 2001.

(7) Air Operations Facilities

Groton-New London Airport is located within the jurisdiction of Boston Air Route Traffic Control Center (ARTCC). IFR arrivals and departures are under control of Providence Approach/Departure Control. Groton-New London Airport's tower was originally manned by FAA personnel. Since November 1994, however, federal budget cuts and low traffic activity caused the FAA to employ contract services for air traffic control at Groton. The tower is equipped and staffed to provide Visual Flight Rules (VFR) separation of arriving and departing aircraft and control of taxiing aircraft in movement areas, i.e. runways and taxiways. Groton's tower hours of operation are 7:00 a.m. to 10:00 p.m. daily.

(8) Public Parking

At-grade parking is provided on-airport at no charge for passengers, visitors, and employees. On-airport parking consists of 245 parking spaces with 8 handicap spaces. The parking lot currently is in good condition and is of adequate size to meet the projected future demand. A majority of the overhead lighting was refurbished during the spring of 1998.

c) Ability of Airport to Meet Current and Future Demands

The growth in operations experienced in the 1980s reflects the growth in the economy during that period and the healthy level of commuter service at the Airport. The decline in operations stems from the recession experienced during the early 1990s and a drop in commuter service. Overall, the operational trends experienced at Groton Airport are occurring at other small regional airports throughout the State, as well as the nation.

It will become increasingly challenging to ensure the continued level of service at the Airport and to meet the future aviation demands at Groton-New London Airport. Proposed improvements include Runway 5-23 safety area improvements, rehabilitation of Runway 15-33, replacement of the Blackjack Ramp that was taken by the Connecticut Army National Guard, t-hangar development for aircraft based at Groton, additional aircraft services, expansion of the Aircraft Rescue and Fire Fighting (ARFF) facility, and landscaping to beautify the roadside at Route 649/Tower Avenue along the perimeter of Groton-New London Airport. Several projects which will be developed in the long term are the rehabilitation/relocation of Taxiway "B" and construction of new FBO/hangars. The Airport is positioning itself to be an important link in the transportation system for the growing southeastern Connecticut region.

Some key factors that will affect the ability of the Airport to meet the current and future aviation demands are new environmental concerns and regulations, new and improved navigational aids, funding, and runway safety improvements. These factors and their effect on the Airport are discussed below.

Environmental Concerns. The impact of new environmental regulations and mandates on safety area improvements and the continual operation of the Airport will need to be addressed. A concern relative to the operation of the Airport is tree penetration of the FAA-mandated Federal Aviation Regulations (FAR) Part 77 imaginary flight surfaces. These imaginary surfaces rise from the Airport's runway environment at certain slopes, based on the type of approach, and should be clear of all obstructions. Currently trees penetrate three runway approaches at the Airport. The removal of these trees will require permits from the Connecticut DEP, the Army Corps of Engineers, and local coordination with city officials and the public. Another concern will be the ability of the Airport to improve and expand the runway safety areas. These improvements will enhance the safety of the general public using the Airport's facilities.

Improved Navigational Aids. The updating of the airport's current navigational aids to meet the future demands on the airport due to increased air traffic, including scheduled air service, will need to be addressed.

Runway Safety Improvements. Recent FAA studies show that most on-airport aircraft accidents occur within 1000' of the runway ends. FAA Advisory Circular 150/5300-13 requires 500' wide runway side safety areas and 1000' long extended runway safety areas for a runway comparable to Runway 5-23. This may not be entirely realistic with the Poquonnock River to the east and south of the runway.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

5. WATERBURY-OXFORD AIRPORT

Waterbury-Oxford Airport, one of six State-owned airports, presently occupies 411.3 acres of land in the towns of Oxford and Middlebury. It is classified in the FAA's National Plan of Integrated Airport Systems as a general utility, general aviation airport. (The role and service level are determined by the type of aircraft the airport can accommodate.) It is home to one fixed-base

operator, Keystone Aviation, one multiple services operator, Executive Flight (a multiple services operator has similar rights as a fixed base operator, excluding fuel sales), and a 12 unit t-hangar complex. A new 48-unit t-hangar facility was constructed in 1999 and is run by Keystone Aviation Services. Currently a new hangar and Control Tower are being constructed on the west side along with a 500' clear span hangar and office facility on the east side of the airport.

This airport currently is operated by ConnDOT's Bureau of Aviation and Ports. It receives funding from the State's General Transportation Fund and federal assistance from the Federal Aviation Administration (FAA). Comprehensive information on the services, facilities, and plans for the Airport is presented in the Waterbury-Oxford Airport Master Plan.

a) Use

Waterbury-Oxford Airport is used to a great extent by private corporations for business travel. As of 2000, Waterbury-Oxford Airport had a total of 215 based aircraft. Listed below are estimates of the number of operations at the Airport during a 12 month period from 1998 to 1999. This information was taken from airport records and the FAA's Airport Master Record, Form 5010.

OPERATIONS AT WATERBURY-OXFORD AIRPORT		
Type of Operation	No. of Operations	% Total Operations
Air Carrier	0	0.0%
Commuter	0	0.0%
Air Taxi	2,200	1.5%
GA Local	100,000	67.8%
GA Itinerate	44,750	30.3%
Military	470	0.4%
Total	147,420	100.0%

Table III-A 7. Operations at Waterbury-Oxford Airport

b) Existing Facilities: Airside and Landside Components

The existing facilities at Waterbury-Oxford Airport consist of one runway with connecting taxiways, apron areas, a general aviation terminal, an administration building, and a fire-rescue and maintenance facility. A control tower is under construction and will be operational in 2001. These facilities and their components are discussed below.

(1) Pavement

Waterbury-Oxford Airport has one runway with the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 18-36	5,000	100

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, ConnDOT's class 1 pavement mix. The pavement conditions at the Airport were analyzed in February 1995 by engineers at the Bureau of Aviation and Ports and summarized in a Pavement Management Plan. A copy of this plan is on file at the Airport. Since the completion of the Pavement Management Plan, Runway 13-31 has been closed and a new aircraft apron has been constructed on the west side of the Airport on the former Runway 13 and Taxiway "B".

The structural life for the constructed pavements is 20 years. Bureau of Aviation and Ports' personnel are continually re-evaluating the Airport's pavements to implement future pavement improvement programs.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement.
- Snow and Ice Removal. Chemicals put on the pavement slowly deteriorate the pavement and could reduce the structural life of the pavement.
- Rubber Deposits and Grooving. The runway pavements are grooved for increased drainage. Over time, rubber deposits form on runways and fill in the grooves. The deposits then need to be removed by high pressure water. Over time, this can loosen stones in the pavement allowing water to saturate the pavement and cause a loss in load bearing capabilities.
- Construction Practices. It is crucial that all pavements be constructed with materials specified and in accordance with FAA specifications. The longevity of a pavement can be impacted by poor construction processes.

(2) Pavement Markings

Waterbury-Oxford Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-1H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing

project, they exhibit longevity. Markings which have been installed this way can last from three to eight years. It is anticipated that all pavement markings will be repainted within the next five years.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing and deicing chemicals deteriorate the pavement markings.
- Traffic. The number of aircraft and vehicles which pass over the markings affect the rate of deterioration of the pavement markings.

(3) Airport Signing

Signing is an integral part of aircraft operations at Waterbury-Oxford Airport. All runways and taxiways are signed in accordance with FAA Advisory Circular 150/5340-18C to insure all aircraft are aware of their location at all times.

After the aircraft has landed, the pilot uses the runway and taxiway signs to guide him/her to a destination on the Airport.

Ability of Signs to Meet Current and Future Demands. Waterbury-Oxford Airport is continually replacing signs to meet all current FAA regulations, during pavement reconstruction and routine maintenance.

The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

As of February 1998 the signs on the airport worked very well. If maintained properly, they should last many years.

Factors Affecting the Condition of or Demand for Signs:

- Rehabilitation of Pavement. There will be a need to re-sign all new pavement to meet FAA regulations as the Airport rehabilitates pavements that have come to the end of their useful design life.
- Weather (Snow). Signs covered by snow are sometimes hit and damaged by plows and blowers. The damaged signs must be replaced to ensure safe airport operations.

(4) Landing Aids

During periods of inclement weather, when the ceiling is less than 1,000 feet or forward visibility is less than three miles, an airport is operating under Instrument Meteorological Conditions (IMC). Information on IFR operations is unavailable, as there is no control tower at the Airport.

Waterbury-Oxford Airport has only one runway equipped to accommodate aircraft operations during IFR conditions. The table below indicates the various Instrument approaches for the runways at the airport.

INSTRUMENT APPROACHES FOR RUNWAYS AT WATERBURY-OXFORD AIRPORT	
RUNWAY	TYPE APPROACHES
18	NDB, GPS
36	ILS, NDB, GPS

Table III-A 8. Instrument Approaches for Runways at Waterbury-Oxford Airport

Airport lighting also serves an integral function in the daily operations at Waterbury-Oxford Airport. The Airport utilizes a complex system of runway and taxiway lighting to aid aircraft in landings and departures during night and/or inclement weather operations. It is the Bureau's goal to maintain the current level of landing and lighting aids standards at the Airport while studying the implementation of additional aids to more efficiently serve the public using Waterbury-Oxford Airport.

(5) General Aviation (GA) Facilities

Waterbury-Oxford Airport plays an important role in general aviation in Connecticut as it is the only general aviation airport in the state with a 5000' runway. (There are only four runways open to the public in Connecticut greater than 5000' in length: three of them are at Bradley International Airport.) Waterbury-Oxford Airport has one fixed base operator, Keystone Aviation, and one multiple services operator, Executive Flight, who provides storage and maintenance facilities and apron areas for based and transient aircraft, and general aviation terminal facilities. The present general aviation facilities also include a 12-unit t-hangar and a 48-unit t-hangar which are presently leased to a private second party. The general aviation facilities are in good condition and of adequate size to serve current levels of activity. One change in general aviation, however, may be to provide additional hangar space for based aircraft. This is predicated on the based aircraft forecast which projects an increase in size and value of these aircraft. Additional private corporate hangars are being built to increase hangar capacity.

c) Ability of Airport to Meet Current and Future Demands

The ability to meet the future aviation demands at Waterbury-Oxford Airport will depend on the State of Connecticut to accomplish several improvement projects at the Airport. Some key factors that will affect the ability of the Airport to meet the current and future aviation demands are new environmental concerns and regulations, improved navigational aids, funding, runway safety area improvements, and a new control tower. These factors and their effect on the Airport are discussed below.

Environmental Concerns. The impact of new environmental regulations and mandates on safety area improvements and the continual operation of the Airport will need to be addressed. Regulated wetlands surround the perimeter of the Airport and any improvements to the runway overrun areas

and to the runway safety areas will require careful planning by ConnDOT with permitting from the Connecticut DEP and the Army Corps of Engineers. The Airport also has numerous penetrations into the FAA FAR Part 77 imaginary flight surfaces. A large percentage of these penetrations are trees. The removal of these trees (i.e. clear cutting) also will require careful planning and coordination with the Connecticut DEP and the Army Corps of Engineers regardless of whether the trees are growing in a regulated wetland or not.

Improved Navigational Aids. To better accommodate IFR conditions, Waterbury-Oxford Airport will need to address complementing its existing ILS on Runway 36 with additional landing aids to lower the existing minimums. An approach lighting system and upgrading the existing middle marker will enhance the Instrument Landing System for Runway 36 and provide the additional safety required by pilots. An additional consideration that is necessary to enhance the ILS for Runway 36 is the relocation or burial of the high tension power lines at the approach end. At their present location the power lines would impair any improvements to the Airport's ILS to Runway 36.

Runway Safety Area Improvements. Recent FAA studies show that most on-airport aircraft accidents occur within 1000' of the runway ends. FAA Advisory Circular 150/5300-13 requires 500' wide runway side safety areas and 1000' long extended runway safety areas for a runway comparable to Runway 18-36. The full safety area may not be entirely realistic with the existing ground contours at either end of the runway, but an effort is being made to enhance the safety areas to benefit the pilots at the Airport. However, careful consideration must be made so that the improvements do not outweigh the financial cost.

Control Tower. A new control tower is under construction and will be completed in the fall of 2000. The tower will then be fitted with all required electronic equipment and manned by FAA contract tower personnel. This tower will greatly enhance the safety of the airport.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

6. WINDHAM AIRPORT

Windham Airport is one of six State-owned airports. It presently occupies 280 acres of land in the town of North Windham. It is classified in the FAA's National Plan of Integrated Airport Systems as a general utility, general aviation airport. (The role and service level are determined by the type of aircraft the airport can accommodate.) Although State-owned, the Airport is managed by Windham Aviation. Windham Aviation, the sole fixed base operator at the Airport, provides maintenance, flight instruction aircraft rental, and fuel for the based and itinerant aircraft at the Airport.

a) Use

Windham Airport is used primarily for general aviation. Listed below are the estimated numbers of operations at the Airport during a 12 month period from 1998 to 1999. This information was taken from the FAA's Airport Master Record, Form 5010.

OPERATIONS AT WINDHAM AIRPORT		
Type of Operation	No. of Operations	% Total Operations
Air Carrier	0	0.0%
Commuter	0	0.0%
Air Taxi	580	1.5%
GA Local	28,625	76.0%
GA Itinerate	8,215	22.0%
Military	300	0.5%
Total	37,720	100.0%

Table III-A 9. Operations at Windham Airport

b) Existing Facilities: Airside and Landside Components

Windham Airport has two paved runways with connecting taxiways, apron areas, and t-hangars. These facilities and their components are discussed below.

(1) Pavement

Windham Airport has two runways with the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 9-27	4,278	100
Runway 18-36	2,797	75

These runways are serviced by a network of four taxiways.

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, ConnDOT's class 1 pavement mix. The pavement conditions at the Airport were analyzed in July 1995 by engineers at the Bureau of Aviation and Ports and summarized in a Pavement Management Plan. A copy of this plan is on file at the Airport. Since the completion of the Pavement Management Plan, Runway 9-27 and Runway 18-36 have been rehabilitated and Taxiway "B" has been extended to the threshold of Runway 36. The structural life for the constructed pavements is 20 years. Bureau of Aviation and Ports' personnel are continually re-evaluating the Airport's pavements to implement future pavement improvement programs.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that

will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement.

- Rubber Deposits and Grooving. The runway pavements are grooved for increased drainage. Over time, rubber deposits form on runways and fill in the grooves. These deposits then need to be removed by high pressure water. Over time, this can loosen stones in the pavement allowing water to saturate the pavement and cause a loss in load bearing capabilities.
- Construction Practices. Most pavements are generally constructed with materials specified and in accordance with FAA specifications. The FAA will entertain proposals for highway mix designs for airports of Windham's size. The longevity of a pavement can be impacted by poor construction processes.

(2) Pavement Markings

Windham Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-1H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing project, they exhibit longevity. Markings which have been installed this way can last from three to eight years. It is anticipated that all pavement markings will be repainted within the next five years.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing can deteriorate the pavement markings. Conditions that necessitate frequent plowing at the airport increase the rate of deterioration of the pavement markings.
- Traffic. The number of aircraft and vehicles that pass over the markings affects the rate of deterioration of the pavement markings. The greater the volume of traffic over the markings the faster the rate of deterioration.

(3) Airport Signing

Signing is an integral part of aircraft operations at Windham Airport. All runways and taxiways are signed in accordance with FAA Advisory Circular 150/5340-18C to insure all aircraft are aware of their location at all times.

After the aircraft has landed, the pilot uses the runway and taxiway signs to guide him/her to a destination on the Airport.

Ability of Signs to Meet Current and Future Demands. Windham Airport is continually replacing signs to meet all current FAA regulations, during pavement reconstruction and routine maintenance.

The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

As of February 1998 the signs on the airport worked very well. If maintained properly, these signs should last many years.

Factors Affecting the Condition of or Demand for Signs:

- Rehabilitation of Pavement. There will be a need to re-sign all new pavement to meet FAA regulations as the Airport rehabilitates pavements that have come to the end of their useful design life.
- Weather (Snow). Signs covered by snow are sometimes hit and damaged by plows and blowers. The damaged signs must be replaced to ensure safe airport operations.

(4) Landing Aids

During periods of inclement weather, when the ceiling is less than 1,000 feet or forward visibility is less than three miles, an airport is operating under Instrument Meteorological Conditions (IMC). IFR weather occurs about 13% of the time at Windham Airport.

In terms of runway approaches, both runways have two possible approach ends. The instrument runway at Windham is runway 27 which utilizes a non-precision localizer approach as indicated in the table below. Windham also has a circling approach based on the Norwich VOR with an attendant GPS overlay.

INSTRUMENT APPROACHES FOR RUNWAYS AT WINDHAM AIRPORT

RUNWAY	TYPE APPROACHES
9, 27, 18, 36	VOR, GPS-A (circling approach)
27	LOC

Table III-A 10. Instrument Approaches for Runways at Windham Airport

Airport lighting also serves an integral function in the daily operations at Windham Airport. The airport utilizes a complex system of runway and taxiway lighting to aid aircraft in landings and departures during night and/or inclement weather operations. It is the Bureau's goal to maintain the

current level of landing and lighting aids standards at the airport while studying the implementation of additional aids to more efficiently serve the public utilizing Windham Airport.

(5) General Aviation (GA) Facilities

Windham Airport's fixed base operator, Windham Aviation, is located in the southeast part of the Airport. It provides aircraft services, aircraft sales, and maintenance for planes and avionics, fueling, flight training, and air charter services. Windham Aviation's facilities consist of one 9,828 s.f. hangar and office space and one 5,610 s.f. hangar. Parking for 34 automobiles, including two handicap spaces, is adjacent to the office/hangar facility. Also Jet-A and 100 LL fuel is available on site. Currently the Airport has 64 based aircraft.

c) Ability of Airport to Meet Current and Future Demands

The ability to meet the future aviation demands at Windham Airport is contingent on the State of Connecticut to accomplish several improvement projects at the Airport. Some key factors that will affect the ability of the Airport to meet the current and future aviation demands are new environmental concerns and regulations, improved navigational aids, funding, and runway safety area improvements. These factors and their effect on the Airport are discussed below.

Environmental Concerns. The impact of new environmental regulations and mandates on safety area improvements and the continual operation of the Airport will need to be addressed. The trees penetrating the FAA-mandated Federal Aviation Regulations (FAR) Part 77 imaginary flight surfaces are a major concern to the operation of the Airport. These imaginary surfaces rise from the Airport's runway environment at certain slopes, based on the type of approach, and must be clear of all obstructions. Currently trees and ground surfaces penetrate or affect all four runway approaches at the Airport. Another concern will be the ability of the Airport to improve and expand the runway safety areas. These improvements will enhance the safety of the general public using the Airport's facilities.

Improved Navigational Aids. The need to update the current navigational aids to enable the Airport to meet the future demands that result from increased traffic must be addressed.

Runway Safety Area Improvements. Recent FAA studies show that most on-airport aircraft accidents occur within 1000' of the runway ends. FAA Advisory Circular 150/5300-13 requires 500' wide runway side safety areas to protect the runway environment and 1000' long extended runway safety areas . This may not be entirely realistic with the existing ground contours at either end of the runway, but an effort must be made to enhance the safety areas to benefit the pilots at the Airport. However, careful consideration must be made so that the improvements do not outweigh the financial cost.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

7. DANIELSON AIRPORT

Danielson Airport presently occupies 257 acres of land in the town of Killingly, 2 miles northwest of Danielson center. It is classified in the FAA's National Plan of Integrated Airport Systems as a general utility, general aviation airport. (The role and service level are influenced by the type of

aircraft the airport can accommodate.) It is home to one fixed base operator, Northeast Air Management, and has airside access to Harvard Ellis Regional Technical School, one of two facilities in Connecticut providing training for aviation mechanics.

The Airport is owned by the State of Connecticut and is privately managed by Northeast Air Management. The Airport receives funding from the State's General Transportation Fund and federal assistance from the FAA. Comprehensive information on the services, facilities, and plans for Danielson Airport is presented in the Danielson Airport Master Plan.

a) Use

Danielson Airport is used to a great extent for local, single engine, general aviation operations. In 1999 Danielson Airport had a total of 55 based aircraft. Listed below is the number of operations at the Airport during a 12 month period from 1998 to 1999. This information was taken from the FAA's Airport Master Record, Form 5010.

OPERATIONS AT DANIELSON AIRPORT		
Type of Operation	No. of Operations	% Total Operations
Air Carrier	0	0.0%
Commuter	0	0.0%
Air Taxi	24	1.0%
GA Local	13,600	66.5%
GA Itinerate	6,840	33.4%
Military	0	0.0%
Total	20,464	100.0%

Table III-A 11. Operations at Windham Airport

b) Existing Facilities: Airside and Landside Components

The existing facilities at Danielson Airport consist of one runway with connecting taxiways, two apron areas, a general aviation terminal, and one t-hangar building. These facilities and their components are discussed below.

(1) Pavement

Danielson Airport has one paved runway with the following characteristics:

Runways	Length (ft)	Width (ft)
Runway 13-31	2,700	75

Condition of Pavement. The pavement used is an approved FAA mix which is close to, but not the same as, ConnDOT's class 1 pavement mix. The pavement conditions at the Airport were analyzed

in July 1995 by engineers at the Bureau of Aviation and Ports and summarized in a Pavement Management Plan. A copy of this plan is on file at the Airport. During the summer/fall of 1998 the entire Airport pavement system was reconstructed. The design structural life for this pavement will be 20 years. Bureau of Aviation and Ports' personnel will continually inspect the new pavement for any sign of fatigue and implement the proper maintenance procedures to ensure it reaches and exceeds its design life.

Factors Affecting the Condition of Airport Pavement. There are many factors that affect the condition of pavement at airports. The most significant are:

- Traffic. The wheel load impacted by the aircraft fatigue the pavement structure. The allowable load is the theoretical maximum gross weight of the design aircraft at a particular pass level that will not cause further load-induced damage to a pavement system. Any additional load over the allowable load on the aeronautical pavements will significantly reduce the remaining structural life of the pavement. However, at Danielson Airport due to the size of the aircraft able to utilize the runway length, the critical design factor is the wheel loads of the snow removal equipment.
- Construction Practices. It is crucial that all pavements be constructed with materials specified and in accordance with FAA specifications. The longevity of a pavement can be impacted by poor construction processes.

(2) Pavement Markings

Danielson Airport maintains pavement markings in accordance with FAA Advisory Circular 150/5340-1H, which depicts how an airport should be marked according to runway categories.

Pavement markings have different useful lives determined by the type of material used for the marking, the location of the marking in relation to vehicle paths and the volume of traffic that passes over the marking.

Pavement markings provide guidance during both day and night operations. The markings are reflectorized for nighttime visibility by incorporating, in the material, small glass or ceramic beads. Pavement markings should be replaced when they are no longer reflective at night.

Ability of Pavement Markings to Meet Current and Future Demands. The Department uses durable pavement markings on airport pavements. When these markings are installed during a resurfacing project, they exhibit longevity. Markings which have been installed this way can last from three to eight years. All pavement markings will be repainted this fall during the pavement reconstruction.

Factors Affecting Condition of or Demand for Pavement Markings:

- Environment. Snow plowing can deteriorate the pavement markings.
- Traffic. The number of aircraft and vehicles which pass over the markings accelerate the deterioration. The greater the volume of traffic over the markings the more rapid the rate of deterioration.

(3) Airport Signing

Signing is an integral part of aircraft operations at Danielson Airport. Runway 13-31 and taxiways A and B are signed in accordance with FAA Advisory Circular 150/5340-18C to insure all aircraft are aware of their location at all times.

Ability of Signs to Meet Current and Future Demands. Danielson Airport will install new signs under State Project 68-183. All new signs will meet current FAA regulations.

The FAA is constantly working on better signs, sign locations, sign materials, and visibility to make airports safer.

Factors Affecting the Condition of or Demand for Signs:

- Safety, Maintenance or FAA Conditions. As required in the future for safety, maintenance, or new FAA regulations, the Airport will implement changes in its Signing.
- Weather (Snow). Signs covered by snow are sometimes hit and damaged by plows and blowers. The damaged signs must be replaced to ensure safe operations.

(4) Landing Aids

During periods of inclement weather, when the ceiling is less than 1,000 feet or prevailing visibility is less than three miles, an airport is operating under Instrument Meteorological Conditions (IMC).

Instrument approaches to the Danielson Airport are VOR or GPS with the lowest minimums requiring Distance Measuring Equipment (DME).

Airport lighting also serves an integral function in the daily operations at Danielson Airport. The Airport utilizes a system of runway and taxiway lighting to aid aircraft in landings and departures during night operations. It is the Bureau's goal to maintain the current level of landing and lighting aids standards at the airport while studying the implementation of additional aids to more efficiently serve the public using Danielson Airport.

(5) General Aviation (GA) Facilities

Danielson Airport plays an important role in General Aviation in western Connecticut, primarily in Windham County. The Airport has one fixed base operator, Northeast Air management, who provides storage and maintenance facilities, apron areas for based and transient aircraft, flight instruction, and general aviation terminal facilities. The present general aviation facilities also include a privately-owned, ten-unit t-hangar facility. The current general aviation facilities are adequate for the level of activity at the Airport. Improvements to these facilities may need to be addressed in the future as needs arise.

c) Ability of Airport to Meet Current and Future Demands

The ability to meet the future aviation demands at Danielson Airport will rely on the increase in general aviation activity at the Airport. Factors that will affect the ability of the Airport to meet

these demands are new environmental concerns and regulations, installing navigational aids, and funding. These factors and their affect on the Airport are discussed below.

Environmental Concerns. The impact of new environmental regulations and mandates on the continued operation of the Airport will need to be addressed. These factors include tree penetrations into the Airport's approach and transitional flight surfaces, regulated wetlands and the Quinebaug River within close proximity to the runway environment. Removal of the trees and any construction in or near the regulated wetlands and floodplains of the Quinebaug River will require permitting and careful coordination with the Connecticut DEP, Army Corps of Engineers and the public.

Installation of Navigational Aids. To better accommodate operations during inclement/IFR conditions, improved navigational aids will be needed.

Funding. A major factor that affects the Airport's ability to meet these current and future demands is funding. The Airport will be able to meet these demands only to the extent that funding is available to do so.

DRAFT

ENSR® INTERNATIONAL

DRAFT

VEGETATION MANAGEMENT PLAN (VMP)
Hartford-Brainard Airport
Hartford, Connecticut

Submitted to:

Connecticut Department of Transportation
2800 Berlin Turnpike
Newington, CT

Prepared by:

ENSR Corporation
2 Technology Park Drive
Westford, Massachusetts 01886

January 2004

5.1 Surface Water Bodies, Wetlands and Watercourses

Hartford-Brainard Airport is located in the Connecticut (River) Basin which drains south into Long Island Sound. The Connecticut River is tidally influenced to its confluence with the Farmington River in Windsor, approximately 10 miles north of the Airport. As a freshwater estuarine environment, this portion of the Connecticut River is ecologically important. Wethersfield Cove and Folly Brook, located immediately south of the Airport, form the Folly Brook Nature Area, an area of flood storage and ecological significance (Section 5.4.1). The Hockanum River and Willow Brook are tributaries of the Connecticut River located northeast of the Airport and east of the Connecticut River in the town of East Hartford. Keeney Cove, located southeast of the Airport in the Town of Glastonbury, is situated on the east side of the Kenney Cove Marsh State Wildlife Area along the east bank of the Connecticut River.

There is no surface water on the Hartford-Brainard Airport property. The Clark Dike separates and protects the Airport from the Connecticut River and its floodplain. Goodwin Park Pond is a small pond located approximately 1.5 miles southwest of the Airport in the town of Wethersfield. A small "pumping station" pond is also located immediately southwest of the Airport in the Town of Wethersfield.

Based on the National Wetlands Inventory (NWI) map, a small palustrine scrub/shrub wetland is located on the southeast corner of the Airport property, adjacent to the Clark Dike. During a 1997 field survey, the Louis Berger Group, Inc. found no other state or federally designated wetlands located within the Airport property.

Federally designated wetlands located outside the Airport boundaries but within the Study Area include:

- along the Connecticut River east of the Clark Dike,
- near the wastewater treatment plant,
- in Wethersfield Cove (Folly Brook Nature Area) south of the Airport,
- along Maxim Road north and northwest of the Airport,
- forested wetlands in the Keeney Cove Marsh State Wildlife Area, on the east bank of the Connecticut River, and
- in the Riverview Park area of the Hockanum River, located northeast of the Airport property.

Hartford Water Pollution Control Plant (HWPCP) is located south of the Airport property and maintains two lagoons immediately south of runway 2/20. The lagoons are a part of the water treatment process and not considered freshwater ponds or wetlands. The Folly Brook Nature Area is primarily a forested floodplain wetland with emergent marsh areas bordering Wethersfield Cove (Section 5.4.1).

The landuse and landcover information for Connecticut, based on LANDSAT Thematic Mapper Satellite Imagery for 1995 and SPOT Panchromatic Satellite Imagery from 1994-1996 data, show approximately 883 acres of wetlands and approximately 868 acres of watercourses within the VMP Study Area (Conical Surface). The approximate wetland/watercourse boundaries are shown on Figure 5-1.

LANDSAT Thematic Mapper Satellite Imagery also identifies wetland acreage based on wetland types. The following is a list of wetland types and acreages identified within the Conical Surface of Brainard Airport:

LANDSAT Wetland type	Acreage

• Deciduous Forested Wetland	10
• Non-forested Wetland	30
• Forest Wetland	460
• Shallow Water/mudflats	37
• Deep Water	3429
Total	3966

5.1.1 Wetland Soil Types in the Study Area

As defined by the USDA Soil Conservation Service Hartford County Soil Survey, wetland soil types located in the Conical Surface and within the Airport property boundary are listed below:

- Fluvaquents-Udifluvents Complex – Alluvial Floodplain Soil - Frequently Flooded
- Limerick and Lim Soils - Alluvial Floodplain Soil - Frequently Flooded
- Raypol Silt Loam – Poorly Drained Soil
- Saco Silt Loam – Alluvial and Floodplain Soil
- Ridgebury, Leicester and Whitman Soils, Extremely Stony
- Scarboro Mucky Loamy Sand – Very Poorly Drained Soil
- Scitico, Shaker, and Maybid Soils – Poorly Drained and Very Poorly Drained
- Walpole Sandy Loam - Poorly Drained Soil

5.2 Designated Public Surface Water Supplies and Municipal Wells

Hartford-Brainard Airport is located in the Connecticut (River) Regional Basin and lies within the Connecticut River Major Drainage Basin. However, there are no public surface water supplies or municipal wells within the Study Area (Figure 5-2).

The Connecticut Department of Environmental Protection (DEP) classifies groundwater located in the vicinity of Airport as Class GB. Class GB groundwater is suitable for use as industrial process water such as cooling water and baseflow for hydraulically-connected surface water bodies. In general, Class GB groundwater is not suitable for human consumption without treatment because of waste discharges, spills or leaks of chemicals, or land use impacts.

5.3 Floodplains and Stream Encroachment Lines

Hartford-Brainard Airport is located outside of the 500-year and 100-year floodplain. The Airport property is mapped as Zone X on the Flood Insurance Rate Map (FIRM) for the City of Hartford (Federal Emergency Management Agency, 1984) (Figure 5-3). Areas mapped as Zone X are determined to be outside the 500-year flood plain. Although floodplains within the 100-year flood boundary border the Connecticut River in the Hartford region, including areas bordering the Airport, the Airport and surrounding areas are protected from floods by the Clark Dike.

Stream Channel Encroachment Lines (SEL's) have been established for approximately 270 linear miles of riverine floodplain throughout the State of Connecticut (DEP Bureau of Water Management, Inland Water Resources Division). An SEL has been placed within the 100-year floodplain adjacent to Brainard Airport (Figure 5-3) and lies within the impact area of proposed VMP activities.

8.6 Intended Chemical (Herbicide) Control Methods

FOLIAGE—the application of herbicides to fully developed leaves, stems, needles or blades of a plant. The herbicide is mixed or diluted with water and applied as a uniform spray over the entire foliage of the plant. The application period usually extends from early June through the beginning of leaf abscission in early Fall. This is generally the most economical and effective method, particularly in medium and high brush density situations.

LOW VOLUME FOLIAGE TECHNIQUES—use hand-operated pumps or motorized backpack sprayers with herbicide concentrations usually ranging from 3-20%. The motorized backpack produces an air current, which delivers the herbicide mixture from a portable spray tank to the target vegetation. The hand pump uses a column of water. In both cases, the herbicide solution is applied only enough to dampen or lightly wet the target vegetation but not to the point of run-off. This minimizes the amount of excess herbicide drip from target species onto desirable ground cover. Low volume applications also eliminate the need to use heavy equipment in order to transport large quantities of herbicide mixture.

- **ANTI-DRIFT AGENTS** are added to the mix or solution in all foliage applications in order to reduce the potential of the herbicide mix to drift beyond target vegetation. Drift control agents reduce the break-up of sprays into fine droplets and help control herbicide deposition on target plants. Even with anti-drift agents, however, there are times when selective foliage application operations must stop due to wind conditions that make it impossible to prevent herbicide movement off the target vegetation.

- **S**urfactants and emulsifiers are added to the mix or solution to allow the solution to spread over the surface of the plant and to increase leaf penetration of the herbicide. These additives allow for better control using less herbicide.

CUT STUMP SURFACE TECHNIQUES (CST)—are the application of an herbicide mixture to the cut surface of a stump immediately following or during a cutting operation using a 50% herbicide concentration diluted in water. In this case, to obtain root control, it is only necessary to treat the phloem and cambium tissue, regardless of the stump diameter. Ideally, treatment should be made to freshly cut stumps, and avoided during the season of high sap flow. Application equipment includes backpack low-volume hand-pumps, hand held squirt bottles, paint brushes, or sponge applicators. This method, like stem basal treatment, is not practical in moderate to heavy stem densities but offers the opportunity to chemically treat undesirable vegetation in extremely sensitive sites where other methods are not possible. Some typical examples are:

- large individual trees
- protective buffers around water
- preparation prior to, or during, a foliage application, where some stems are over 12' high.

8.7 Use of Fuels in Wetlands

Equipment used in wetlands that requires refueling may only be refueled using a "closed system" refueling method. For large vehicles this means a hose and nozzle system, no open jugs. Refueling will only occur in the wetland if removing the vehicle from the wetland will cause more damage to the wetland than bringing in the refueling equipment. For small equipment like chainsaws and motorized backpack sprayers, only two and a half gallon jugs with "Spill Stopper" mechanisms will be allowed. In areas of heavy cutting refueling stations will be set up with the fuel jugs stored in large plastic tubs with "soak up pads". Chainsaws will be refueled on "soak up pads."

11.0 OPERATIONAL GUIDELINES FOR APPLICATORS RELATIVE TO HERBICIDE USE

Brainard Airport will rely on independent contractors for vegetation management herbicide applications and require, in a contractual agreement, that contractors comply with all applicable federal and state laws and regulations. This includes, but is not limited to, applicable Occupational Health and Safety (OSHA), FIFRA. and ConnDOT regulations.

Both the contractor and the Airport are responsible to insure that vegetation management activities are conducted in a professional, safe and efficient manner, with special attention directed towards minimal environmental impact. A designated Environmental Monitor will be responsible for monitoring vegetation management programs in wetlands and other Sensitive Resources. The Airport Engineer is responsible for the overall administration and coordination of vegetation removal at the Airport.

When properly handled and applied in accordance with regulations, herbicides are not hazardous to the human or natural environment. Based on previous experience of the ENSR Team, the application of herbicides on Airport property will amount to only ounces per acre once the VMZ's of stable native vegetation have been established.

The VMP Contractor must provide qualified, state licensed and/or certified personnel to apply herbicides at the Airport. "Qualified" should be interpreted to mean those personnel who have been trained to recognize and identify target (incompatible) and non-target (compatible) vegetation and are knowledgeable in the safe and proper use of both mechanical and chemical vegetation management techniques. All personnel applying herbicides in Connecticut must have a Connecticut Operator's License. Furthermore, a person with a Connecticut Supervisor's License must be on site at all times.

Herbicides will only be applied in a safe and judicious manner, in compliance with all applicable State (CT DEP) and Federal (EPA) pesticides regulations. Vegetation management crews will exercise care to insure that low-growing desirable species and other non-target organisms are not unreasonably affected by the application of herbicides.

Herbicides will be handled and applied only in accordance with the labeled instructions. VMP Contractors will strictly adhere to all mandated safety precautions directed towards the public, the applicator, and the environment. Herbicide applicators will wear all personal protection equipment prescribed by the labeled instructions. Applicators will at all times exercise good judgment and common sense during herbicide treatment activities, and will immediately cease operations if adverse conditions or other circumstances warrant.

Herbicides will <u>not</u> be applied during the following adverse weather conditions:

- During high wind velocity,
- Foliar applications during periods of dense fog, or moderate to heavy rainfall,
- Foliar applications of volatile herbicides during periods of high temperatures, (90 plus degrees Fahrenheit), and low humidity,
- When deep snow (i.e., 6" plus or ice frozen on stems or stumps) prevents adequate coverage of target plants to facilitate acceptable control.

Herbicides applications will also adhere to the following conditions:

Re: Confirmation and Issuance of Registration
General Permit for Contaminated Soil and/or Sediment Management (Staging and Transfer)
Application No: 200802739
CTDOT Project No. 0063-0561
REGISTRATION NO: DEP/CSST-064-22-080
PERIOD OF AUTHORIZATION: December 15, 2008 through December 15, 2010

Dear Mr. Dorosh:

By this letter, the Department of Environmental Protection ('the Department') is notifying you that it has received and processed the Connecticut Department of Transportation application for the General Permit for Contaminated Soil and/or Sediment Management - Staging and Transfer. This application was received by the Department on December 2, 2008 and was submitted for a registration to transfer and temporarily stage contaminated soil at an off-site location in volumes less than 10,000 cubic yards. The off-site location is Brainard Road Ramp over Route 5/15, Bristol, Connecticut.

The registration number and valid period of this authorization is noted above. Connecticut Department of Transportation may request an extension of this registration by submitting a new registration form and fee to the Department for a 'renewal of registration' no later than 120 days prior to the expiration date of this registration. Please be aware that such extensions are granted only in one-year increments and only at the discretion of the commissioner. The issuance of this registration does not relieve the Connecticut Department of Transportation from seeking and obtaining local Planning and Zoning or Inland Wetlands approvals.

If you have any questions regarding the General Permit for Contaminated Soil and/or Sediment Management - Staging and Transfer or this letter, please do not hesitate to contact Carmen P. Holzman at (860) 424-3569.

Sincerely,

Gabrielle Frigon

1.0 INTRODUCTION

On behalf of the Connecticut Department of Transportation (ConnDOT), Maguire Group Inc. (MGI) has conducted a Task 210 – Subsurface Site Investigation Report in association with the construction of the Maintenance and Aircraft Rescue and Fire Fighting (ARFF) Facility at Brainard Airport in Hartford, Connecticut.

Based upon a review of the project Scope of Work and Preliminary Site Plan by others, the project will include the construction of a new maintenance and ARFF building (approximately 9,340 s.f.), site improvements and utilities, and paved parking for the employees. The proposed project is to the west of the existing ConnDOT maintenance facility at Brainard Airport located at 233 Maxim Road in Hartford. This Task 210 was conducted in areas of anticipated construction activities for the proposed project. Figure 1 depicts the project area.

The purpose of this Task 210 – Subsurface Site Investigation Report is to verify the absence or presence and location of subsurface contamination, and to assess the potential pollutant impacts to be encountered during construction of the proposed structure, parking area, site improvements and utilities. It is anticipated that Task 310 Plans, Specifications and Estimate will subsequently be prepared to assess construction related activities (i.e. proper storage, classification, transport and disposal of contaminated materials), in relationship to the environmental conditions prevalent within the project limits, as well as to specify remedial work to be included in the Contract Bid Documents.

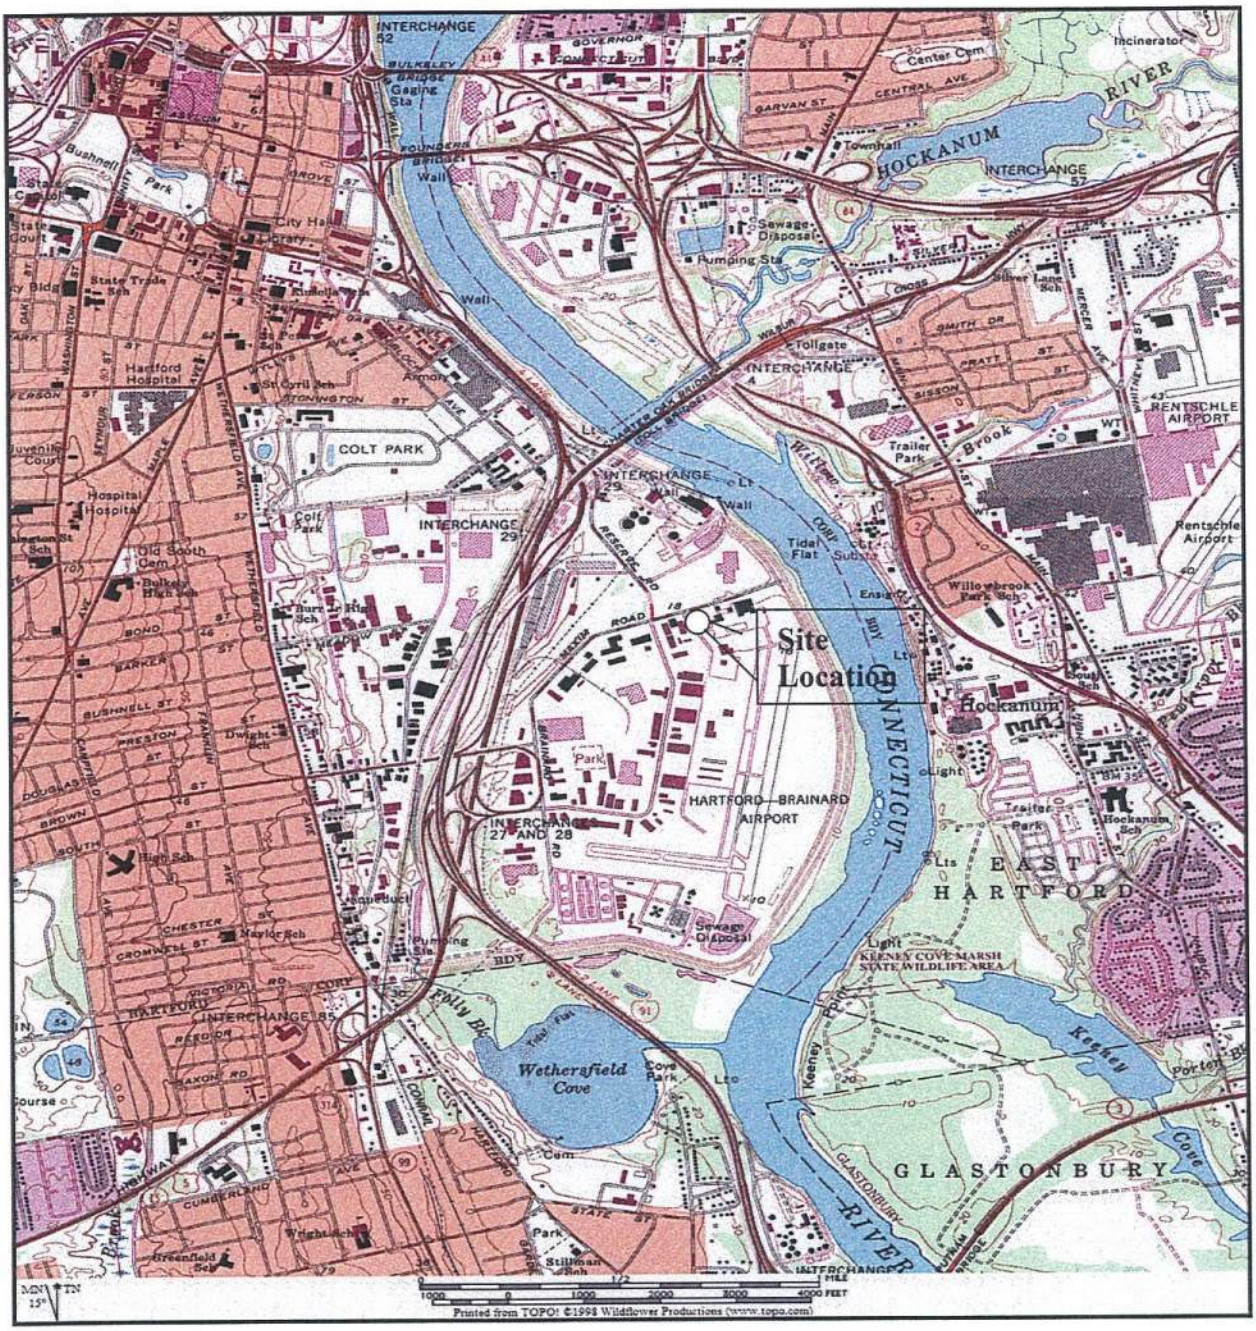

FIGURE 1 - SITE LOCATION PLAN

Brainard Airport – Maintenance and ARFF Facility

Hartford, Connecticut

2.0 SITE DESCRIPTION

2.1 Background

ConnDOT is proposing to construct a new maintenance and ARFF facility located at Brainard Airport on Maxim Road in Hartford, CT. The new facility will be constructed to the west of the existing ConnDOT maintenance facility located at 233 Maxim Road. The proposed facility will house a bunk room and kitchen/common room for the current/proposed staff for this facility. There are no true offices within this building and the maintenance offices will remain in the existing building. The facility will include a FAA compliant wash bay, a crane bay including a 3-ton overhead crane for equipment handling and two separate chain link enclosures for the storage of tanks. The proposed project also includes site improvements and utilities related to the new building and paved parking.

This Task 210 was conducted in areas of anticipated construction activities for the proposed project. The site area and sample locations are depicted on Figure 2 - Project Area & Sampling Location Plan included at the end of this Report.

3.0 LOCAL ENVIRONMENT & RECEPTORS

3.1 Geology

The Site is located within the Hartford Basin of the Central Lowlands, which is underlain by Portland Arkose bedrock according to the Bedrock Geological Map of Connecticut. Portland Arkose is described as a reddish brown arkose and is also known as brownstone. The surficial materials at the site are classified as alluvium according to the Geologic Map of the Hartford South Quadrangle. These materials are composed of a mixture of floodplain deposits consisting of sand, silt, clay and gravel. Soils encountered during this investigation consisted of gray-brown to red-brown silt with trace clay overlain by red-brown fine to coarse sand and gravel, cobbles and silt. Crushed asphalt was observed in borings GP-10, GP-11, GP-14 and GP-15 at a

depth of 4.5-feet to 6-feet below grade. A petroleum odor was indicated in the fill material observed in boring GP-13 at a depth of 2.4-feet to 4.0-feet below grade.

3.2 Groundwater, Surface Water & Topography

The CTDEP has designated the groundwater beneath the Site and surrounding area as "GB", indicating that groundwater is within a historically highly urbanized area or an area of intense industrial activity and where public water supply is available. Such groundwater may not be suitable for human consumption without treatment due to waste discharges, spills or leaks of chemicals or land use impacts. Groundwater beneath the Site is presumed to flow in an easterly direction towards the Connecticut River. Groundwater was observed in all the borings at depths ranging from 4.5-feet to 7-feet below grade.

The Site is located within the Connecticut River Regional Basin. The nearest surface water body is the Connecticut River, located approximately 1,000-feet east of the Site. The Connecticut River is classified as a Class "SC/SB" surface water body by the CTDEP. The Class "SC/SB" designation indicates that the surface water quality is known to be tidally influenced and does not meet water quality criteria for one or more of the following uses: recreational use, fish and wildlife habitat, agricultural and industrial supply and other legitimate uses including navigation. Based on site topography, surface water flows overland to the on-site drainage system which discharges to the storm drainage system in the street.

4.0 SUBSURFACE INVESTIGATION

Based upon the current and former industrial and commercial nature of the surrounding area, a comprehensive sampling program was conducted within the project limits. The following subsections detail the investigation.

4.1 Geoprobe® Soil Borings & Soil Sample Analyses

On July 7, 2011, fifteen (15) Geoprobe® borings were advanced within the project limits. The Geoprobe® boring areas were advanced by Logical Environmental Solutions, LLC under the direction of Maguire. The Geoprobe® boring locations (GP-1 to GP-15) are depicted on the Task 210: Subsurface Site Investigation Soil Boring Location Plan at the end of this Report.

The Geoprobe® soil borings were advanced to a depth of 8 feet or refusal within the project limits, utilizing a 4-foot long 2-inch diameter Macro Core Sampler with dedicated acetate liners. The soil samples were visually inspected in the field for staining, and were described as to physical characteristics and soil type. Soil boring logs were generated in the field by the on-site qualified technician. In addition, the soil samples were screened in the field for total volatile organic compounds utilizing a Photovac photoionization detector (PID). The boring logs denote the types of soil encountered, the depth to groundwater and/or bedrock, the total depth reached in each boring, and the highest observed PID reading. Copies of the boring logs are included at the end of this report in Appendix A.

Based upon field screening results and visual observations, one (1) soil sample from each boring was placed in laboratory-supplied glassware from Con-Test Analytical Laboratory of East Longmeadow, MA. If visual screening did not indicate contamination, the surficial soil sample, 1 to 3-feet below grade, was collected for laboratory analyses. The analyses of all soil samples included volatile organic compounds (VOCs) utilizing EPA Method 8260, base neutral/acid extractable semi-volatile compounds (BNAs) utilizing EPA Method 8270, extractable total petroleum hydrocarbons (ETPH) utilizing the Connecticut ETPH method, polychlorinated biphenyls (PCBs) utilizing EPA Method 8082, and total and SPLP RCRA 8 metals.

All Geoprobe® soil borings were back-filled upon completion utilizing clean sand and/or hydrated bentonite. Soil borings within paved areas were backfilled upon completion and patched with bituminous pavement ("cold patch"). All down-hole sampling equipment was decontaminated in the field between each use utilizing an Alconox and water bath and de-ionized rinse.

4.2 Groundwater Sample Collection & Analyses

Two (2) groundwater grab samples, GP-6 GW and GP-13 GW, were be collected from the boring locations GP-6 and GP-13 designated on the sample location plan, Figure 2. The groundwater grab samples were collected by inserting one-half inch diameter, schedule 40, 10-slot, PVC well screen and riser casing into the borehole. The well screen was temporarily installed approximately 4 feet into the observed water table depth. Dedicated polyethylene tubing was placed into the temporary well and the groundwater grab sample was drawn through the tubing using a low-flow peristaltic pump in accordance with the EPA's "Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures". The groundwater sample were collected for laboratory analysis of VOCs (EPA Method 8260), BNAs (EPA Method 8270), ETPH (Connecticut ETPH), PCBs (EPA Method 8082), and Total and Dissolved RCRA 8 metals. Groundwater samples collected for Dissolved-phase RCRA metals were field filtered using a 0.45-µm membrane filter prior to acidification. The groundwater samples were placed in laboratory-supplied glassware, and stored in an ice-filled cooler.

4.3 Project Quality Assurance/Quality Control Practices

The CTDEP's Quality Assurance and Quality Control (QA/QC) Guidance were used to ensure that the analytical results generated during the investigation are of known and appropriate quality. Specifically, the Laboratory Quality Assurance Control Reasonable Confidence Protocols (RCPs) were utilized for all laboratory analytical methods. The Laboratory Quality Assurance and Quality Control, Data Quality Assessment and Data Usability Evaluation (DQA/DUE) Guidance were utilized to ensure that the analytical data used is of known and

sufficient level of quality for the intended purpose. See Sections 5.4 and 5.5 of this report for a discussion of the QA/QC procedures and data usability evaluation.

To assess the collection of samples in the field in terms of the sampling techniques and decontamination procedures followed, quality control and quality assurance samples were collected and analyzed. A trip blank, TP-1, was prepared by Con-Test Analytical Laboratory and a field blank sample was collected in the field. The field blank was prepared by pouring laboratory supplied de-ionized water over decontaminated sampling equipment and collecting the resulting rinsate in appropriate sample containers. The trip and field blank samples were stored with the daily samples in the sample cooler until delivery to the laboratory for analysis. The field blank was analyzed for the same parameters specified for the daily samples and the trip blank was analyzed for VOCs.

All samples collected in the field were stored in a manner that preserves the integrity of the sample chemistry. Samples intended for organic analyses were stored in an ice-filled cooler until delivery to the laboratory. Chain-of-Custody (COC) forms were filled out and accompanied all samples collected as a legal record of possession of the sample. The COC was initiated in the field and accompanied the containers during sample collection, transportation to the lab, analysis, and final disposal of the sample. All sampling equipment was either dedicated to a specific sample or was decontaminated prior to and between each use. Sampling equipment was not be placed near solvents, gasoline, or other materials that may have impacted the integrity of the sample.

5.0 DISCUSSION OF SAMPLE RESULTS

5.1 Regulatory Criteria

The CTDEP adopted Remediation Standard Regulations (Regulations of Connecticut State Agencies, Section 22a-133k-1 to 3 and 22a-133q-1) as of January 31, 1996. The Remediation Standard Regulations (RSRs) apply to any site undergoing voluntary remediation under Public Acts 95-183 or 95-190, a transfer of an "establishment" under Public Act 95-183, or any site as ordered by the CTDEP Commissioner. The Regulations also outline the processes for establishing alternative site-specific numerical standards for certain sites, upon approval by the CTDEP.

The RSRs criteria applicable to the soil and groundwater sampled during this investigation are summarized below. The application of these RSRs to the results of the laboratory analyses from this investigation are discussed in subsections 5.2 and 5.3 of this section.

Soils Criteria: The RSRs are organized into two sets of criteria: the Direct Exposure Criteria (DEC) and the Pollutant Mobility Criteria (PMC). The DEC and PMC are briefly explained in the following sub-sections, in relation to how they would be applicable to the types of analyses conducted on the soil samples collected for this investigation. Please refer to the RSRs for a complete explanation of the Regulations.

Direct Exposure Criteria

The purpose of the Direct Exposure Criteria (DEC) is to protect human health from risks associated with the direct contact with or ingestion of various common soil contaminants. The DEC are applicable to soil within approximately fifteen (15) feet of the ground surface. Concentrations of contaminants are evaluated based upon mass-based analyses and different criteria are established for residential and industrial/commercial properties. The use of the less stringent commercial/industrial standards requires the placement of an environmental land use restriction on the property.

The DEC is not applicable to inaccessible soils, including soil more than four (4) feet below the ground surface, two (2) feet below pavement greater than three (3) inches thick, or below an existing building, provided that an Environmental Land Use Restriction (ELUR) is placed in effect for the property.

Pollutant Mobility Criteria

The purpose of the Pollutant Mobility Criteria (PMC) is to evaluate the potential for contaminants to leach from the soil in concentrations that may degrade groundwater quality. Different numerical criteria are established for GA and GAA groundwater areas, versus GB groundwater areas. Since the groundwater classification for the project area is GB, the less stringent PMC would apply to this Site.

Groundwater Criteria: Under the CTDEP RSRs, contaminants in the groundwater are compared either to background quality or the Groundwater Protection Criteria (GWPC), the Volatilization Criteria (VC), as well as the Surface Water Protection Criteria (SWPC). However, ConnDOT has had numerous discussions with CTDEP staff with regard to groundwater encountered during "Construction Projects" and the applicability of the RSRs to these situations. Based on the guidance provided by CTDEP, groundwater samples collected were compared to the effluent limits for the ***"General Permit for the Discharge of Groundwater Remediation Wastewater Directly to Surface Water"*** (GP to Surface Water) and the ***"General Permit for the Discharge of Groundwater Remediation Wastewater Directly to Sanitary Sewer"*** (GP to Sanitary Sewer) to determine if Groundwater Areas of Environmental Concern (GW AOECs) for construction dewatering exist within the project limits.

5.2 Results of Soil Sample Analyses

The results of the soil sample analyses indicated the presence of ETPH at six (6) boring locations, GP-1, GP-3, GP-10, GP-11, GP-13, and GP-14. ETPH was detected in soil samples, GP-1 (1'-3'), GP-3 (1'-3'), GP-10 (1'-3'), GP-11 (1'-3'), GP-13 (2'-4'), and GP-14 (1'-3') at concentrations of 23 mg/kg, 160 mg/kg, 44 mg/kg, 32 mg/kg, 68 mg/kg, and 59 mg/kg, respectively, which is below the applicable CTDEP RSR criteria.

PCBs were not detected in any of the soil samples analyzed at concentrations above analytical detection limits (ND).

VOCs were detected above analytical detection limits in two (2) of the fifteen (15) soil samples collected and analyzed. 1,2,4-Trimethylbenzene (0.0066 mg/kg) and 1,3,5-Trimethylbenzene (0.0046 mg/kg) were detected in soil sample GP-12 (4'-8') at concentrations below the applicable CTDEP RSR criteria. No other VOCs were detected in soil sample GP-12 (4'-8') at concentrations above analytical detection limits (ND). n-Butylbenzene (0.98 mg/kg), Naphthalene (0.11 mg/kg), 1,2,4-Trimethylbenzene (0.0053 mg/kg) and 1,3,5-Trimethylbenzene (0.0022 mg/kg) were detected in soil sample GP-13 (2'-4') at concentrations below the applicable CTDEP RSR criteria. No other VOCs were detected in soil sample GP-13 (2'-4') at concentrations above analytical detection limits (ND). VOCs were not detected above analytical detection limits (ND) in the remaining soil samples analyzed.

BNAs were detected above analytical detection limits in six (6) of the fifteen (15) soil samples collected and analyzed. BNAs were detected in soil samples, GP-3 (1'-3'), GP-10 (1'-3'), and GP-15 (1'-3') at concentrations above analytical detection limits, but below the applicable CTDEP RSR Criteria. Benzo(a)anthracene (5.5 mg/kg), Anthracene (2.8 mg/kg), Benzo(a)pyrene (4.8 mg/kg), Benzo(b)fluoranthene (5.4 mg/kg), Benzo(k)fluoranthene (2.8 mg/kg), Chrysene (5.6 mg/kg), and Indeno(1,2,3-cd)pyrene (2.7 mg/kg) were detected in soil sample GP-9 (1'-3') at concentrations exceeding the CTDEP GB PMC of 1.0 mg/kg for these compounds. Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, and Indeno(1,2,3-cd)pyrene were also present at concentrations that exceed the CTDEP RDEC of 1.0 mg/kg for

these compounds. Also, the concentration of Benzo(a)pyrene detected exceeds the CTDEP I/C-DEC of 1.0 mg/kg for this compound.

Benzo(b)fluoranthene (1.2 mg/kg) and Chrysene (1.2 mg/kg) were detected in soil sample GP-11 (1'-3') at concentrations exceeding the CTDEP GB PMC and RDEC of 1.0 mg/kg for these compounds.

Benzo(a)anthracene (18 mg/kg), Benzo(a)pyrene (13 mg/kg), Benzo(b)fluoranthene (15 mg/kg), Benzo(k)fluoranthene (6.1 mg/kg), Carbazole (1.5 mg/kg), Chrysene (20 mg/kg), Dibenz(a,h,)anthracene (1.5 mg/kg), Dibenzofuran (5.7 mg/kg), Indeno(1,2,3-cd)pyrene (5 mg/kg), and 2-Methylnaphthalene (25 mg/kg) were detected in soil sample GP-13 (2'-4') at concentrations exceeding the applicable CTDEP GB PMC. Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Dibenz(a,h)anthracene, and Indeno(1,2,3-cd)pyrene were also present at concentrations that exceed the CTDEP RDEC of 1.0 mg/kg for these compounds. Also, the concentration of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, and Dibenz(a,h)anthracene detected exceeds the applicable CTDEP I/C-DEC.

Total Arsenic, Barium, Cadmium, Chromium, Lead, and Mercury were detected in at varying concentrations in the soil samples collected and analyzed. The concentrations of all detected total metals were below the applicable CTDEP RSR Criteria. Leachable Arsenic, Barium, Cadmium, Chromium, Lead, and Mercury were also detected at varying concentrations below the applicable CTDEP RSR Criteria with the exception of leachable Lead in soil sample GP-13 (2'-4'). Leachable Lead was detected in soil sample GP-13 (2'-4') at concentration of 0.2 mg/L which exceeds the CTDEP GB PMC of 0.15 mg/L. No other total or leachable metals were detected at concentrations above analytical detection limits (ND).

A summary of the laboratory results from the soil samples is presented in Tables 1(a) to 1(d), which are located at the end of this report, and copies of the analytical results associated with the soil samples are included in Appendix B.

5.3 Results of Groundwater Sample Analyses

The results of the groundwater sample analyses indicated the presence of ETPH at concentrations of 0.1 mg/L (GP-6 GW) and 0.2 mg/L (GP-13 GW) which are below the effluent limits of 5 mg/L for the CTDEP GP to Surface Water and 100 mg/L for the CTDEP GP to Sanitary Sewer.

Toluene was detected in groundwater sample GP-6 GW at a concentration of 1.4 ug/L, which is below the effluent limits of 10 ug/L for Total VOCs for the CTDEP GP to Surface Water and 5,000 ug/L for Total VOCs for the CTDEP GP to Sanitary Sewer. No other VOCs were detected in the groundwater samples at concentrations above analytical detection limits (ND).

BNAs and PCBs were not detected above analytical detection (ND) in either groundwater sample analyzed.

Total Arsenic (0.015 mg/L), Barium (0.41 mg/L), Cadmium (0.0029 mg/L), Chromium (0.099 mg/L), and Lead (0.052 mg/L) were detected in groundwater sample GP-13 GW. The concentrations of Total Arsenic and Lead detected exceed the CTDEP GP to Surface Water effluent limits, but are below the CTDEP to Sanitary Sewer effluent limits. However, Dissolved Arsenic and Lead were not detected above analytical detection limits (ND) in groundwater sample GP-13 GW. Total Barium was detected at a concentration of 0.085 mg/L in groundwater sample GP-6 GW, which is below the CTDEP GP to Sanitary Sewer effluent. The CTDEP GP to Surface Water does not have an established effluent limit for Barium. No other total metals were detected in groundwater sample GP-6 GW at concentrations above analytical detection limits (ND). Dissolved Arsenic (0.0028 mg/L) and Barium (0.075 mg/L) were detected in groundwater sample GP-6 GW. The concentration of Dissolved Arsenic exceeds the CTDEP GP to Surface Water effluent limit of 0.000021 mg/L, but are below the CTDEP to Sanitary Sewer effluent limits. No other dissolved metals were detected in groundwater sample GP-6 GW at concentrations above analytical detection limits (ND).

A summary of the laboratory results from the groundwater samples is presented in Table 2, which is located at the end of this report, and copies of the analytical results associated with the groundwater samples are included in Appendix B.

5.4 Quality Assurance/Quality Control Samples

The field blank sample FB-1 did not contain any detectable concentrations of ETPH, BNAs, PCBs and RCRA Metals. A detectable concentration of Chloromethane in the field blank sample FB-1 is likely due to field or laboratory contamination. The trip blank, TB-1 did not contain detectable concentrations of VOCs. A summary of the laboratory results from the QA/QC samples is presented in Table 3, which is located at the end of this report, and copies of the analytical results associated with the quality assurance/quality control samples are included in Appendix D.

5.5 Data Quality Assessment and Data Usability Evaluation (DQA/DUE)

Fifteen (15) soil, and two (2) groundwater samples were collected from within the project limits and submitted to a state-certified analytical laboratory for analyses using the CTDEP Reasonable Confidence Protocols (RCPs) established for VOCs, BNAs, ETPH, metals, and PCBs. The samples were collected to verify the absence or presence and location of subsurface contamination, and to assess the potential pollutant impacts to be encountered during construction of the Brainard Airport Maintenance & ARFF Facility.

A data quality assessment and data usability evaluation were performed for the data generated in accordance with CTDEP guidance and noted the following quality control non-conformances. Copies of the DQA and DUE worksheets are included in Appendix C.

Non-conformances related to Laboratory Control Sample/Laboratory Control Sample Duplicates (LCS/LCSDs) recoveries, LCS/LCSD Relative Percent Differences (RPDs), Matrix Spikes/Matrix Spike Duplicate (MS/MSDs) recoveries, equipment blanks, Continuing Calibration Verification (CCVs), and Initial Calibration (ICAL) responses do not have

significant bearing on the accuracy and usability of the data for its intended uses. In all cases the non-conformances had no impact on the data usability and the data is of sufficient quality and precision for its intended use based on multiple lines of evidence.

Based on the above findings from the DQA and DUE, the analytical data is of adequate quality and of sufficient accuracy, precision and sensitivity to confirm that contaminants of concern are present in the soil and groundwater at concentrations exceeding the CTDEP RSRs and GP to Surface Water effluent limits. Task 310 Plans, Specifications and Estimate will be required to assess construction related activities (i.e. proper storage, classification, transport and disposal of contaminated materials), in relationship to the environmental conditions prevalent within the project limits, as well as to specify remedial work to be included in the Contract Bid Documents.

6.0 DISCUSSION OF AFFECTED RESOURCES

Based upon the results of the laboratory analyses performed on soil, and groundwater samples for this Task 210 investigation, two (2) areas of environmental concern (AOECs) for soil have been identified where contaminants are present at concentrations that exceed the applicable CTDEP RSR criteria. One (1) groundwater AOECs has also been identified where contaminants are present at concentrations that exceed the applicable CTDEP GP effluent limits. In addition, three (3) low-level areas of environmental concern (LLAOECs) for soil have been identified, where contaminants were detected at concentrations below the applicable CTDEP RSR standards, but above laboratory detection limits. The locations of the AOECs and LLAOECs within the project limits are discussed in the following sections.

6.1 Areas of Environmental Concern (AOECs)

GP-9 & GP-13

Analytical results from the soil samples collected from borings GP-9 and GP-13 indicated the presence of BNAs at elevated concentrations in soil ranging from 1 to 4 feet below grade.

Leachable Lead was also detected at an elevated concentration in boring GP-13 in soil ranging from 2 to 4 feet below grade. The contamination detected exceeds the applicable PMC and RDEC. Low concentrations of ETPH and VOCs below the CTDEP RSR criteria were also detected in the soil samples.

GP-11

Analytical results from the soil sample collected from boring GP-11 indicated the presence of BNAs at elevated concentrations in soil ranging from 1 to 3 feet below grade. The contamination detected exceeds the applicable PMC and RDEC. A low concentration of ETPH below the CTDEP RSR criteria was also detected in the soil sample.

GP-6 GW & GP-13 GW

Analytical results from the groundwater grab sample collected from boring GP-6 indicated the presence of dissolved Arsenic at an elevated concentration exceeding the CTDEP GP to Surface Water effluent limit. In addition, ETPH and Toluene at concentrations below the CTDEP GP effluent limits were detected in the groundwater grab sample collected from boring GP-6. ETPH was also detected in the groundwater sample collected from boring GP-13, but at a concentration below the CTDEP GP effluent limits. Numerous leaking underground storage tanks (USTs) have been identified at sites surrounding and adjacent to the project limits. Also, leaking USTs were listed on CTDEP's "List of Contaminated or Potentially Contaminated Sites" for 233 Maxim Road property. This property is located directly upgradient and adjacent to the proposed projects limits. Based on the extractable petroleum hydrocarbons detected in the groundwater. associated petroleum breakdown constituents detected in both soil and groundwater, and the fact that adjacent and surrounding properties are on CTDEP's "List of Contaminated or Potentially Contaminated Sites", the entire project limits have been designated a AOEC for groundwater.

6.2 Low-Level Areas of Environmental Concern (LLAOECs)

GP-1

Analytical results from the soil sample collected from boring GP-1 indicated the presence of ETPH at concentrations above analytical detection limits, but below the CTDEP RSR standards. The contaminants were detected in soil ranging from 1 to 3 feet below grade.

GP-3

Analytical results from the soil sample collected from boring GP-3 indicated the presence of ETPH and BNAs at concentrations above analytical detection limits, but below the CTDEP RSR standards. The contaminants were detected in soil ranging from 1 to 3 feet below grade.

GP-10, GP-12, GP-14 & GP-15

Analytical results from the soil samples collected from borings GP-10, GP-12, GP-14 and GP-15 indicated the presence of ETPH, VOCs and BNAs at concentrations above analytical detection limits, but below the CTDEP RSR standards. The contaminants were detected in soil ranging from 1 to 3 feet below grade in borings GP-10, GP-14 and GP-15 and 4 to 8 feet below grade in boring GP-12.

7.0 RECOMMENDATIONS

The results of the Task 210 – Subsurface Site Investigation Report for the Brainard Airport Maintenance & ARFF Facility in Hartford, Connecticut indicate the presence of BNAs and leachable lead at concentrations exceeding the applicable CTDEP RSR criteria at boring locations GP-9, GP-11, and GP-13. The contamination was detected in soils ranging from 1 to 4 feet below grade. In addition, the results of the Task 210 indicated the presence of dissolved arsenic at concentrations exceeding the CTDEP GP to Surface Water effluent limits in the groundwater grab sample collected from boring location GP-6.

Two (2) areas of environmental concern (AOECs) for soil have been identified within the project limits. The entire project limits have also been designated an AOEC for groundwater. In addition, three(3) low-level areas of environmental concern (LLAOECs) for soil have been identified. Special considerations for treatment/disposal, dewatering activities, and worker health & safety must be given to these areas in order to ensure compliance with all local, State and Federal laws. Task 310 Plans, Specifications, and Estimate are therefore, recommended for the areas of construction with the AOECs and LLAOECs described in Section 6.0 above.

8.0 LIMITATIONS

All work product and reports provided by Maguire Group Inc. (Maguire) in connection with the performance of this Task 210 - Subsurface Site Investigation Report are subject to the following limitations:

1. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services provided to ConnDOT.

2. In preparing this report, Maguire has relied on certain information provided by State and local officials and information and representations made by other parties referenced therein, and on information contained in the files of State and/or local agencies made available to Maguire at the time of this investigation. To the extent that such files are missing, incomplete or not provided to Maguire, Maguire is not responsible. Although there may have been some degree of overlap in the information provided by these various sources, Maguire did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this investigation.

3. The conclusions and recommendations contained in this report are based in part upon the data from subsurface explorations. The nature and extent of variations between these explorations may not become evident until further explorations are completed. If variations or other latent conditions become evident, it will be necessary to re-evaluate the conclusions and recommendations of this report.

4. The water level readings made for this investigation were made at the times and conditions stated on the boring logs. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, passage of time and other factors. Should additional data become available in the future, these data should be reviewed by Maguire, and the conclusions and recommendations presented herein modified accordingly.

5. Where quantitative laboratory analyses have been conducted by an outside certified laboratory, Maguire has relied upon the data provided, and has evaluated the data in accordance with CTDEP DQA/DUE Guidance, but has not conducted an independent evaluation of the reliability of these tests.

6. If the conclusions and recommendations contained in this report are based, in part, upon various types of chemical data, then the conclusions and recommendations are contingent upon the validity of such data. These data have been reviewed and interpretations made in the report. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by Maguire and the conclusions and recommendations presented herein modified accordingly.

7. Chemical analyses were performed for specific parameters during the course of this investigation, as described in the text. However, it should be noted that testing for all known chemical constituents was not performed. The conclusions and recommendations contained in this report are based only upon the chemical constituents for which testing was accomplished.

The following qualifications apply to the undersigned's opinion:

The activities described and opinions included herein are based on information gathered during this subsurface site investigation, which was limited in scope in adherence to the terms of our agreement. The professional opinion provided herein is based on the information described in this report.

The information contained herein was prepared for the use of ConnDOT solely in conjunction with the task descriptions for this assignment. The conclusions and recommendations set forth in this report are based on site conditions at the time of the investigation. Future studies and

findings could change the contents of this report. The professional opinions presented in this report have been developed by using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental engineering consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional opinions included in this report.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 6020, only RCRA 8 metals were requested and reported.

For method 6010, only RCRA 8 metals were requested and reported.

con-test® ANALYTICAL LABORATORY
39 Spruce Street * East Longmeadow, MA 01028 * FAX 413/525-6405 * TEL. 413/525-2332

CTDEP ETPH

Qualifications:

Matrix spike and spike duplicate recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possiblity of matrix effects that lead to low bias or non-bomogeneous sample aliquot cannot be eliminated.

Analyte & Samples(s) Qualified:

CT ETPH

11G0202-02RE1[GP-2 1-3ft], B033535-MS1, B033535-MSD1

SW-846 8260C

Qualifications:

Reported result is estimated. Value reported over verified calibration range.

Analyte & Samples(s) Qualified:

Naphthalene

11G0202-13[GP-13 2-4ft]

Laboratory fortified blank /laboratory control sample recovery outside of control limits. Data validation is not affected since all results are "not detected" for all samples in this batch for this compound and bias is on the high side.

Analyte & Samples(s) Qualified:

2-Butanone (MEK), 2-Hexanone (MBK), 4-Methyl-2-pentanone (MIBK), Tetrahydrofuran

B033503-BS1, B033420-BS1, B033474-BS1, 11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-03[GP-3 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], B033503-BLK1

Laboratory fortified blank/laboratory control sample recovery is outside of control limits. Reported value for this compound is likely to be biased on the low side.

Analyte & Samples(s) Qualified:

Dichlorodifluoromethane (Freon 12)

11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-03[GP-3 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], 11G0202-09[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-14[GP-14 1-3ft], 11G0202-15[GP-15 1-3ft], B033503-BLK1, B033503-BS1, B033584-BLK1, B033584-BS1

Continuing calibration did not meet method specifications and was biased on the low side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the low side.

Analyte & Samples(s) Qualified:

Dichlorodifluoromethane (Freon 12)

11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-03[GP-3 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], 11G0202-09[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-14[GP-14 1-3ft], 11G0202-15[GP-15 1-3ft], B033503-BLK1, B033503-BS1, B033584-BLK1, B033584-BS1

Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy are associated with reported result.

Analyte & Samples(s) Qualified:

2-Butanone (MEK), Acetone, Tetrahydrofuran

11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-03[GP-3 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], B033503-BLK1, B033503-BS1, 11G0202-09[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-14[GP-14 1-3ft], 11G0202-15[GP-15 1-3ft], B033584-BLK1, B033584-BS1

Continuing calibration did not meet method specifications and was biased on the bigh side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:

2-Butanone (MEK), 2-Hexanone (MBK), 4-Methyl-2-pentanone (MIBK), Tetrahydrofuran

B033503-BS1, B033420-BS1, B033474-BS1, B033501-BS1

Hit confirmed in duplicate analysis

Analyte & Samples(s) Qualified:

Chloromethane
11G0202-18[FB-1]

SW-846 8270D

Qualifications:

Reported result is estimated. Value reported over verified calibration range.

Analyte & Samples(s) Qualified:

2-Methylnaphthalene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(h)fluoranthene, Chrysene, Fluoranthene, Fluorene, Naphthalene, Phenanthrene, Pyrene
11G0202-13[GP-13 2-4ft], 11G0202-09[GP-9 1-3ft]

Laboratory fortified blank/laboratory control sample recovery and duplicate recoveries outside of control limits. Data validation is not affected since all results are "not detected" for associated samples in this batch and bias is on the high side.

Analyte & Samples(s) Qualified:

3/4-Methylphenol, Bis(2-chloroisopropyl)ether, Pentachloronitrobenzene
11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-04[GP-4 1-3ft], B033546-BLK1, B033546-BS1, B033546-BSD1, B033478-BS1, B033478-BSD1

Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.

Analyte & Samples(s) Qualified:

3/4-Methylphenol, 4-Nitrophenol
B033550-BSD1, B033550-BS1

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

Analyte & Samples(s) Qualified:

2,4,6-Trihromophenol, 2-Fluorohiphenyl, 2-Fluorophenol, Nitrohenzene-d5, Phenol-d6, Terphenyl-d14
11G0202-13RE1[GP-13 2-4ft]

One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.

Analyte & Samples(s) Qualified:

2,4,6-Trihromophenol
11G0202-09RE1[GP-9 1-3ft], B033478-BS1, B033478-BSD1, B033550-BS1, B033550-BSD1

Surrogate recovery is outside of control limits. Data validation is not affected since all results are less than the reporting limit and bias is on the high side.

Analyte & Samples(s) Qualified:

2,4,6-Trihromophenol, 2-Fluorophenol
11G0202-17[GP-13 GW], 11G0202-18[FB-1], B033478-BLK1

Initial calibration did not meet method specifications. Compound was calibrated using a response factor wbere %RSD is outside of method specified criteria.

Analyte & Samples(s) Qualified:

2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, Benzo(g,h,i)perylene, Hexachloroethane
11G0202-03[GP-3 1-3ft], 11G0202-09[GP-9 1-3ft], 11G0202-09RE1[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-13[GP-13 2-4ft], 11G0202-13RE1[GP-13 2-4ft], 11G0202-14[GP-14 1-3ft], 11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], 11G0202-15[GP-15 1-3ft], B033546-BLK1, B033546-BS1, B033546-BSD1, B033550-BLK1, B033550-BS1, B033550-BSD1, B033478-BS1, B033478-BSD1

Continuing calibration did not meet method specifications and was biased on the low side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the low side.

Analyte & Samples(s) Qualified:

Hexachlorocyclopentadiene

B033546-BLK1, B033546-BS1, B033546-BSD1

Continuing calibration did not meet method specifications and was biased on the high side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the high side.

Analyte & Samples(s) Qualified:

2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, Bis(2-chloroisopropyl)ether, Hexachlorocyclopentadiene

B033478-BLK1, B033478-BS1, B033478-BSD1

Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy are associated with reported result.

Analyte & Samples(s) Qualified:

Pentachloronitrobenzene

11G0202-01[GP-1 1-3ft], 11G0202-02[GP-2 1-3ft], 11G0202-03[GP-3 1-3ft], 11G0202-04[GP-4 1-3ft], 11G0202-05[GP-5 1-3ft], 11G0202-06[GP-6 1-3ft], 11G0202-07[GP-7 1-3ft], 11G0202-08[GP-8 1-3ft], 11G0202-09[GP-9 1-3ft], 11G0202-09RE1[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-13[GP-13 2-4ft], 11G0202-13RE1[GP-13 2-4ft], 11G0202-14[GP-14 1-3ft], 11G0202-15[GP-15 1-3ft], 11G0202-16[GP-6 GW], 11G0202-17[GP-13 GW], 11G0202-18[FB-1], B033478-BLK1, B033478-BS1, B033478-BSD1, B033546-BLK1, B033546-BS1, B033546-BSD1, B033550-BLK1, B033550-BS1, B033550-BSD1

Initial calibration did not meet method specifications. Compound was calibrated using linear regression with correlation coefficient <0.99.

Analyte & Samples(s) Qualified:

3/4-Methylphenol

B033478-BS1, B033478-BSD1

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:

2,4-Dimethylphenol, 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, Hexachlorocyclopentadiene

11G0202-09[GP-9 1-3ft], 11G0202-10[GP-10 1-3ft], 11G0202-11[GP-11 1-3ft], 11G0202-12[GP-12 4-8ft], 11G0202-13[GP-13 2-4ft], 11G0202-03[GP-3 1-3ft], 11G0202-09RE1[GP-9 1-3ft], 11G0202-13RE1[GP-13 2-4ft], 11G0202-14[GP-14 1-3ft], 11G0202-16[GP-6 GW], 11G0202-17[GP-13 GW], 11G0202-18[FB-1]

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation whicb have not been rounded.
E	Reported result is estimated. Value reported over verified calibration range.
L-01	Laboratory fortified blank /laboratory control sample recovery outside of control limits. Data validation is not affected since all results are "not detected" for all samples in this batch for this compound and bias is on the higb side.
L-02	Laboratory fortified blank/laboratory control sample recovery and duplicate recoveries outside of control limits. Data validation is not affected since all results are "not detected" for associated samples in this batch and bias is on the high side.
L-03	Laboratory fortified blank/laboratory control sample recovery is outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
MS-07A	Matrix spike and spike duplicate recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possiblity of matrix effects that lead to low bias or non-bomogeneous sample aliquot cannot be eliminated.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
S-07	One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.
S-17	Surrogate recovery is outside of control limits. Data validation is not affected since all results are less than the reporting limit and bias is on the high side.
V-04	Initial calibration did not meet metlod specifications. Compound was calibrated using a response factor where %RSD is outside of method specified criteria.
V-05	Continuing calibration did not meet method specifications and was biased on the low side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the low side.
V-06	Continuing calibration did not meet method specifications and was biased on the high side for this compound. Increased uncertainty is associated with the reported value which is likely to be biased on the high side.
V-16	Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy are associated with reported result.
V-19	Initial calibration did not meet method specifications. Compound was calibrated using linear regression with correlation coefficient <0.99.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
Z-01	Hit confirmed in duplicate analysis

con-test® ANALYTICAL LABORATORY

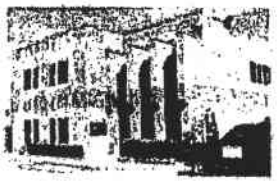
Sample Receipt Checklist



CLIENT NAME: MGI RECEIVED BY: SD DATE: 7/8/11

1) Was the chain(s) of custody relinquished and signed? (Yes) No No CoC Included

2) Does the chain agree with the samples? (Yes) No

If not, explain:

3) Are all the samples in good condition? (Yes) No

If not, explain:

4) How were the samples received:

On Ice ☑ Direct from Sampling ☐ Ambient ☐ In Cooler(s) ☑

Were the samples received in Temperature Compliance of (2-6°C)? (Yes) No N/A

Temperature °C by Temp blank _____ Temperature °C by Temp gun 2.8°C

5) Are there Dissolved samples for the lab to filter? Yes (No)

Who was notified _____ Date _____ Time _____

6) Are there any RUSH or SHORT HOLDING TIME samples? Yes (No)

Who was notified _____ Date _____ Time _____

7) Location where samples are stored: 19

Permission to subcontract samples? Yes No

(Walk-in clients only) if not already approved

Client Signature: _____

Containers received at Con-Test

	# of containers		# of containers
1 Liter Amber	15	8 oz amber/clear jar	
500 mL Amber		4 oz amber/clear jar	
250 mL Amber (8oz amber)	30	2 oz amber/clear jar	
1 Liter Plastic		Air Cassette	
500 mL Plastic		Hg/Hopcalite Tube	
250 mL plastic	6	Plastic Bag / Ziploc	
40 mL Vial - type listed below	S.D. 53 56	PM 2.5 / PM 10	
Colisure / bacteria bottle		PUF Cartridge	
Dissolved Oxygen bottle		SOC Kit	
Encore		TO-17 Tubes	
Flashpoint bottle		Non-ConTest Container	
Perchlorate Kit		Other glass jar	
Other		Other	

Laboratory Comments:

40 mL vials: # HCl 12 # Methanol S.D. 5 14

Bisulfate _____ # DI Water 30

Thiosulfate _____ Unpreserved _____

Time and Date Frozen: 07-08-11 17:18 IN

Do all samples have the proper Acid pH? (Yes) No N/A _____

Do all samples have the proper Base pH: Yes No (N/A) _____

REASONABLE CONFIDENCE PROTOCOL
LABORATORY ANALYSIS QA/QC CERTIFICATION FORM

Laboratory Name: Con-Test Analytical Laboratory

Client: Maguire Group Inc.

Project Location: Hartford, CT - Brainard Airport

Project Number: 11G0202

Laboratory Sample ID(s):

11G0202-01 thru 11G0202-19

Sample Date(s):

07/07/2011

List RCP Methods Used:

CTDEP ETPH, SW-846 1312, SW-846 6010C, SW-846 6020A, SW-846 7470A, SW-846 7471B, SW-846 8082A, SW-846 8260C, SW-846 8270D

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the CTDEP method-specific Reasonable Confidence Protocol documents?	☑ Yes ☐ No
1A	Were the method specified preservation and holding time requirements met?	☑ Yes ☐ No
1B	VPH and EPH Methods only: Was the VPH and EPH method conducted without significant modifications (see Section 11.3 of respective RCP methods)?	☐ Yes ☐ No ☑ N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	☑ Yes ☐ No
3	Were samples received at an appropriate temperature (< 6 degrees C.)?	☑ Yes ☐ No ☐ N/A
4	Were all QA/QC performance criteria specified in the CTDEP Reasonable Confidence Protocol documents achieved?	☐ Yes ☑ No
5A	Were reporting limits specified or referenced on the chain-of-custody?	☑ Yes ☐ No
5B	Were these reporting limits met?	☐ Yes ☑ No
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the Reasonable Confidence Protocol documents?	☐ Yes ☑ No
7	Are project-specific matrix spikes and laboratory duplicates included in this data set?	☑ Yes ☐ No

Notes: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1A, or #1B is "No", the data package does not meet the requirements for "Reasonable Confidence."
This form may not be altered and all questions must be answered.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete.

Authorized Signature:  **Position:** Laboratory Director

Printed Name: Michael A. Erickson **Date:** 07/20/11

Name of Laboratory: Con-Test Analytical Laboratory

This certification form is to be used for RCP methods only.

APPENDIX C
DQA & DUE Worksheets

DATA USABILITY EVALUATION WORKSHEET

Project Name: Task 210 - Brainard Airport Maintenance Facility & ARFF Facility - Hartford, CT

Laboratory: Con-Test Analytical Laboratory

Laboratory Report: 11G0202

Date Samples Collected: July 7, 2011

Describe the intended use of the data: To verify the absence or presence and location of subsurface contamination, and to assess the potential pollutant impacts that may be encountered during construction

Nonconformance DQA Review Elements	Briefly Summarize DQA Nonconformance
Standard RCP Deliverables	
Data Package Inspection	
Reasonable Confidence Evaluation	
Chain of Custody Evaluation	
Sample Result Evaluation	
Sample Preservation & Holding Time Evaluation	
Blank Evaluation	Chloromethane detected at low concentration in field blank sample - compound not detected in any soil or groundwater samples
Laboratory Control Samples	LCS/LCSD recoveries and RPDs show potential high and low biases for VOCs and BNAs in the soil & aqueous samples. Potential bias is outweighed by non-detections (for high bias) or detection limits/detections orders of magnitude less than any applicable RSR criteria.
Surrogates	BNA & ETPH surrogates show potential low bias in soil and groundwater samples. Bias outweighed by detection limits/detections orders of magnitude less than applicable RSR criteria
Site-Specific Matrix Spikes and Matrix Spike Duplicates	ETPH MS/MSD recoveries show potential low bias, but LCS/LCSD recoveries acceptable
Tentatively Identified Compounds	
Other QC Data	Calibration ranges for GP-9 and GP-13 soil samples for BNAs and VOC naphthalene were exceeded. The reported values for several compounds are estimated. Reported values are more than 4X greater than RSR criteria.

DATA USABILITY EVALUATION WORKSHEET

Provide a summary statement describing how the analytical data set relied upon is of adequate quality and of sufficient accuracy, precision, and sensitivity for the intended purpose.

The results will be used to verify the absence or presence and location of subsurface contamination, and to assess the potential pollutant impacts that may be encountered during construction

A data quality assessment and data usability evaluation was performed for the data generated in accordance with the CTDEP's "Laboratory Quality Assurance and Quality Control, Data Quality Assessment and Data Usability Evaluation Guidance Document".

Non-conformances related to LCS/LCSD, MS/MSD, surrogates, field calibration ranges, equipment blanks, CCVs, and ICAL responses do not have significant bearings on the accuracy and usability of the data for its intended purposes. In all cases the non-conformances have no impact to the data usability and is considered of sufficient quality and precision using multiple lines of evidence.

The data indicates that contaminants are present in the soil and groundwater at low to moderate concentrations that exceed applicable RSR criteria. Task 310 Plans and Specifications will be prepared to address the soil and groundwater contamination during the construction phase.

Based on the above findings from the DQA and DUE, the analytical data is of adequate and of sufficient accuracy, precision and sensitivity to identify areas requiring special treatment and/or handling during the construction phase of the project.

FOREWORD

On behalf of the Connecticut Airport Authority (CAA), McFarland-Johnson, Inc. has prepared this Stormwater Pollution Prevention Plan (SWPPP) for the Hartford-Brainard Airport (Airport) in support of a Connecticut Department of Energy and Environmental Protection (CT DEEP) General Permit for Discharge of Stormwater Associated with Industrial Activity (GP-014). The General Permit went into effect on October 1, 2011, was modified in December of 2013 and October 1, 2016, and expires on September 30, 2018. The General Permit is included in **Appendix A**.

Section 402 of the Clean Water Act (CWA) provides that stormwater discharges associated with industrial activity from a point source to waters of the United States are unlawful, unless authorized by a National Pollutant Discharge Elimination System (NPDES) permit. EPA has authorized Connecticut to administer the NPDES permit program. Section 22a-430b of the Connecticut General Statutes (CGS) requires that all discharges to surface waters in the State of Connecticut have permits for discharge.

Stormwater discharges associated with industrial activity are defined in 40 CFR Section 122.26(b)(14)(i) through (ix) and (xi) and include "conveying stormwater and that is directly related to manufacturing, processing or raw materials storage at an industrial plant".

The CT DEEP General Permit requires the preparation of a SWPPP. The industrial SWPPP has three major objectives:

1. To identify and evaluate sources of pollutants associated with industrial activities that may affect the quality of stormwater discharges and authorized non-stormwater discharges from the facility.

2. To identify and implement site-specific Best Management Practices (BMPs) to reduce or prevent pollutants associated with industrial activities in stormwater discharges and authorized non-stormwater discharges.

3. To meet the requirements of Section 5(c) "Stormwater Pollution Prevention Plan" of the General Permit.

The CAA operates facilities that fall under the definition of "industrial activity". Section (2)(8) of the General Permit includes "transportation facilities...vehicle service and storages facilities (including, but not limited to, public works garages) operated by federal, state or municipal government which have vehicle maintenance and repair shops, equipment cleaning, fueling or maintenance operations, road salt storage, or airport deicing operations."

In accordance with Section 3(c) of the General Permit, the registration process was initiated with the filing of a registration form. The General Permit Registration Form submitted in 2011 for the Discharge of Stormwater Associated with Industrial Activity is included in **Appendix B**. The CT DEEP assigned the Airport the following permit identification number: **GS000915**.

The SWPPP is developed in accordance with good engineering practices and identifies potential sources of pollution that may be reasonably expected to affect the quality of stormwater discharges.

This SWPPP establishes the practices that are undertaken to reduce the potential for pollutants to be discharged with stormwater to surface waters of the state and those appropriate to ensure compliance with the permit. The SWPPP covers only those portions of the Airport that are involved in aircraft, vehicle, and equipment maintenance; aircraft, vehicle, and equipment cleaning operations; and deicing/anti-icing operations, if applicable.

Signature and SWPPP Availability

The SWPPP has been certified in accordance with the requirements Section 5(c)(7) of the General Permit (see page vii), and a copy of the SWPPP will be retained at the Hartford-Brainard Airport FBO, Airport Manager's Office, and the CAA administrative offices.

Keeping the SWPPP Current – Amendments

In accordance with Section 5(c)(5) of the General Permit, the SWPPP will be updated whenever there is a change at the site which has an effect on the potential to cause pollution of the surface waters of the state and/or if the SWPPP fails to ensure or adequately protect against pollution of the surface waters of the state. Other reasons for amending the SWPPP are included in Section 5(c)(5) of the General Permit. In accordance with Section 5(c)(5) of the General Permit, amendments must be completed within 120 days.

If significant changes are made to the SWPPP, it must be recertified in accordance with Section 5(c)(5) of the General Permit.

In accordance with the General Permit, the SWPPP and Permit Registration Form will be modified, if necessary, to address future projects prior to their operation.

SIGNATURES AND CERTIFICATIONS

Management Certification

As required by the General Permit, this plan must be signed by a responsible corporate officer of CAA.

"I have personally examined and am familiar with the information submitted in this document and all attachments thereto, and I certify that, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining the information, the submitted information is true, accurate and complete to the best of my knowledge and belief. I understand that a false statement made in the submitted information may be punishable as a criminal offense, in accordance with section 22a-6 of the General Statutes, pursuant to section 53a-157b of the General Statutes, and in accordance with any other applicable statute."

Kevin A. Dillon — Signature

02/04/19 — Date

KEVIN A. DILLON — Printed Name of Permittee

EXECUTIVE DIRECTOR — Title

Professional Engineer Certification

"I certify that I have thoroughly and completely reviewed the Stormwater Pollution Prevention Plan prepared for this site. I further certify, based on such review and site visit by myself or my agent, and on my professional judgment, that the Stormwater Pollution Prevention Plan meets the criteria set forth in the General Permit for the Discharge of Stormwater Associated with Industrial Activity effective on October 1, 2011. I am aware that there are significant penalties for false statements in this certification, including the possibility of fine and imprisonment for knowingly making false statements."

Concord, NH 03301-8500

Non-Stormwater Discharges Certification

"I certify that in my professional judgment, the stormwater discharge from the site consists only of stormwater, or of stormwater combined and wastewater authorized by an effective permit issued under Section 22a-430 or Section 22a-430b of the Connecticut General Statutes, including the provisions of this general permit, or of stormwater combined with any of the following discharges provided they do not contribute to a violation of water quality standards:

- *landscape irrigation or lawn watering;*
- *uncontaminated groundwater discharges such as pumped groundwater, foundation drains, water from crawl space pumps and footing drains;*
- *discharges of uncontaminated air conditioner or refrigeration condensate;*
- *water sprayed for dust control or at a truck load wet-down station;*
- *naturally occurring discharges such as rising groundwaters, uncontaminated groundwater infiltration (as defined at 40 CFR 35.2005(20)), springs, and flows from riparian habitats and wetlands.*

This certification is based on testing and/or evaluation of the stormwater discharge from the site. I further certify that all potential sources of non-stormwater at the site, a description of the results of any test and/or evaluation for the presence of non-stormwater discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test have been described in detail in the Stormwater Pollution Prevention Plan prepared for the site. I further certify that no interior building floor drains exist unless such floor drain connection has been approved and permitted by the commissioner or otherwise authorized by a local authority for discharge as domestic sewage to sanitary sewer. I am aware that there may be significant penalties for false statements in this certification, including the possibility of fine and imprisonment for knowingly making false statements."

1.0 FACILITY DESCRIPTION AND CONTACT INFORMATION

1.1 FACILITY INFORMATION

Name of Facility: Hartford-Brainard Airport (Airport Identifier KHFD)

Street: 233 Maxim Road

City (Mailing): Hartford City (Physical): Hartford State: CT ZIP Code: 06114

County or Similar Subdivision: Hartford

Permit Tracking Number: GSI000915 (if covered under a previous permit)

Latitude/Longitude (Use **one** of three possible formats, and specify method)

Latitude:	Longitude:
1. 41 º 44 ' 12.20" N (degrees, minutes, seconds)	1. 72 º 38 ' 58.00" W (degrees, minutes, seconds)
2. _ _ º _ _ . _ _ ' N (degrees, minutes, decimal)	2. _ _ º _ _ . _ _ ' W (degrees, minutes, decimal)
3. º N (decimal)	3. º W (decimal)

Method for determining latitude/longitude (check one):

☐ USGS topographic map (specify scale:_____) ☐ EPA Web site ☐ GPS

☒ Other (please specify): FAA Airport Reference Point

Estimated area of industrial activity at site exposed to stormwater: approximately 201 (acres)

Discharge Information

Does this facility discharge stormwater into an MS4? ☒ Yes ☐ No

If yes, name of MS4 operator: Metropolitan District Commission (MDC)

Name(s) of water(s) that receive stormwater from your facility: Connecticut River

Are any of your discharges directly into any segment of an "impaired" water? ☒ Yes ☐ No

If Yes, identify name of the impaired water (and segment, if applicable):

Connecticut River (Segment CT4000-00-03)

Identify the pollutant(s) causing the impairment: Polychlorinated biphenyls (PCBs) and Escherichia coli (E. Coli)

For pollutants identified, which do you have reason to believe will be present in your discharge?

_____

For pollutants identified, which have a completed TMDL? E. Coli Statewide TMDL

Are any of your stormwater discharges subject to effluent guidelines? ☐ Yes ☒ No

If Yes, which guidelines apply? _____

Primary SIC Code or 2-letter Activity Code: 4581

Identify your applicable sector and subsector: Sector G

1.2 CONTACT INFORMATION/RESPONSIBLE PARTIES

Facility Owner/Operator (s):

Name: Connecticut Airport Authority
Contact: Sally Snyder, Manager of Environmental Compliance Programs
Address: 334 Ella Grasso Turnpike, Suite 160

2.0 INTRODUCTION

The Airport is a public use facility, owned and operated by the CAA. The Airport is located in the city of Hartford, Hartford County, Connecticut. The Airport operates under a CT DEEP General Permit for the Discharge of Stormwater Associated with Industrial Activity in accordance with Section 22a-430b of the Connecticut General Statutes (CGS). The CT DEEP assigned the Airport a permit identification number **GS00915** (see the CT DEEP Registration Form in **Appendix B**).

The industrial activities at the Airport include airport activities which fall under the Standard Industrial Classification (SIC) code 4581 and is defined in the General Permit as the following:

Sector G – Transportation and Public Works – Small Airports

For purposes of this document, "facility" refers to the Airport and appurtenant facilities, including tenants and the Fixed Base Operator (FBO) whose operations result in stormwater discharges associated with industrial activities. The facility does not include areas where there are no industrial activities associated with the Airport.

The Airport is a commercial service non-primary airport with general aviation (GA) facilities. The SWPPP only addresses existing conditions and Airport improvements completed as of the date of the SWPPP.

2.1 SITE DESCRIPTION

The Airport is located along the Connecticut River in the southeastern portion of the city of Hartford. East Hartford is located east of the Connecticut River and the town of Wethersfield is located to the south of the Airport property. Airport property abuts the Clark Dike, which separates the Airport from the Connecticut River to the east, Maxim Road to the north, Lindbergh Drive to the west, and the MDC Water Pollution Control Plant operations to the south. Land uses located around the Airport include, industrial and commercial to the north and west and open space to the east and south. No residential areas are located within the immediate vicinity of the Airport. The nearest residentially zoned area within the city of Hartford is located approximately 1.5 miles northwest of the Airport, between Interstate 91 and Colt Park. The Airport and surrounding area is depicted on a USGS Location Map, **Figure 1** and Aerial Map, **Figure 2**.

The Airport contains two asphalt runways, designated Runway 2-20 and Runway 11-29, a turf runway, referred to as Runway NE/SW, and two helipads, H1 and H2. Runway 2-20 is the primary runway and measures 4,417 feet long by 150 feet wide. Runway 11-29 is 2,314 feet long by 71 feet wide. The turf runway is 2,309 feet by 150 feet and closed during the winter months. The Midfield Helipad, H1, located near Taxiway D, is 44 feet by 44 feet. Two helicopter parking spaces are located next to the helipad. The North Helipad, H2, located near the Runway 20 end, is 70 feet by 77 feet. The Airport has a system of eight taxiways, with designations "A" through "D", "H", "J", "V", "W", providing access for the tenants and aircraft storage facilities to the runways. Both runways are served by full length, parallel taxiways, ranging from 25 to 50 feet wide, on the west side of the airfield. Aircraft aprons/ramps consist of four main aircraft parking areas, South Ramp, Midfield Ramp, FBO Ramp, and North Ramp.

The Airport contains a terminal building, five conventional hangars for private and FBO operations, five T-hangars, Air Traffic Control Tower (ATCT), office buildings, CAA maintenance facility, Airport Rescue and Fire Fighting building (ARFF), and Aviation School. CAA owns all of the property and buildings, and leases them to tenants.

Tenants located on Airport property include Hartford Jet Center (FBO), Connecticut Aerotech School, ATP Flight School, CT State Police, CT T-Hangars, Excel Avionics, Hartford T-Hangars, Premier Flight Center, Total Aircraft Repair, VIP Avionics, CT Wing Civil Air Patrol, The Flying Monkey Grill & Bar.

According to the Airport Master Plan Update (MPU), dated April 2015, the airfield is serviced by all essential utilities; water, sanitary, electric, natural gas, and telecommunication lines are connected to the Terminal Building and all other major facilities/businesses on the Airport. Currently, the sewer and stormwater lines are combined within the city of Hartford.

The Airport is divided into four drainage areas with Discharges A through D (see **Figure 3**). Drainage areas A and B discharge to the Connecticut River. Drainage areas C and D discharge to an MS4 operated by the MDC. The Airport stormwater management system and drainage areas will be discussed further in Section 4.7.

Security fencing at the Airport provides coverage along the Airport's landside but does not cover the eastern boundary along the Clark Dike. Entry to airside facilities are controlled and restricted to authorized individuals only.

The Airport Drainage Map provided as **Figure 3** presents the locations of Airport facilities, stormwater features and impervious areas on the site.

Figure 2: Aerial Map

Document Path: K:\CAA\T-18137.02 CAA-SWPPP Updates\Draw\Brainard\GIS\Hartford Aerial.mxd

2.2 STORMWATER POLLUTION PREVENTION TEAM

The following individuals are members of the Pollution Prevention Team (PPT) and are responsible for implementing the SWPPP and assisting in the implementation, maintenance, and development of revisions to the SWPPP as well as maintaining control measures and taking corrective actions where required.

Table 2. Pollution Prevention Team

Team Member(s)/Title	Telephone	Responsibility
Program Coordinator CAA, Division of Environmental Compliance	(860) 254-5634	Coordinate development, implementation, and revision of SWPPP.
Team Leader / Airport Coordinator or Designee	(203) 264-8010 (860) 818-5848	Inspections and implementation, annual employee training program, oversee good housekeeping practices and preventative maintenance activities onsite.
Team Members: Airport Fire Captain Airport Maintenance Crew	(860) 779-4900 (860) 625-1198	Assist with the SWPPP responsibilities as designated by Airport Coordinator. Spill prevention and response, scheduling of inspections and maintenance of records. Isolation, containment, and cleanup procedures.

Source: CAA.

2.3 GENERAL PERMIT CONDITIONS

The General Permit includes conditions and requirements set forth in the following sections.

2.3.1 Coastal Management Act

In accordance with the General Permit, industrial activities must not cause adverse impacts to coastal resources as defined in section 22a-93(15) of the CGS. The Airport is not located within a coastal boundary.

2.3.2 Aquifer Protection

In accordance with Appendix C of the General Permit, when considering stormwater infiltration practices, the SWPPP should consider measures to reduce or mitigate potential impacts to both groundwater (aquifers) and surface waters. According to the CT DEEP Aquifer Protection Areas (APA) Map dated September 6, 2017, the Airport is not located within a Level A or B APA and therefore, the Airport is not required to implement additional stormwater control measures.

2.3.3 Threatened & Endangered Species

The CT DEEP Natural Diversity Data Base Areas Map, dated December 2017, was reviewed to determine the presence of state and federal listed species and significant natural communities on or in the vicinity of the Airport. The map indicated that the Airport is located within an area identified as habitat for endangered, threatened or special concern species (see **Appendix F**).

The United States Fish & Wildlife Service (USFWS) Information for Planning and Conservation (IPaC) Online Screening Tool was referenced on January 11, 2018 to obtain information on species listed on the federal Endangered Species Act. An IPaC Official Species List report generated for this project did not identify any federally-listed threatened or endangered species or critical habitat. However, IPaC identified 26 migratory bird species, including the bald eagle (*Haliaeetus leucocephalus*) with distributional ranges that included the project area. A copy of the IPaC reports are provided in **Appendix F**.

2.3.4 Control Measures

In accordance with Section 5(b) of the General Permit, the Airport must implement Best Management Practices (BMP) to minimize and/or eliminate pollutant discharges to the extent achievable using control measures that are technologically available and economically practicable and achievable in light of best industry practice. In addition, the CAA and/or tenants must minimize and/or eliminate the exposure of manufacturing, processing, and material storage areas (including loading and unloading, storage, disposal, cleaning, maintenance, and fueling operations) to rain, snow, snowmelt and runoff. Control measures are described in Section 4.0 of the SWPPP.

2.3.5 Maintaining Water Quality

In accordance with Section 5(a) of the General Permit, the authorized industrial activities must be conducted in accordance with the following conditions:

- *The stormwater discharge shall not cause or contribute to an exceedance of the applicable Water Quality Standards in the receiving water;*
- *There shall be no distinctly visible floating scum, oil or other matter contained in the stormwater discharge; and*
- *The discharge shall not result in pollution due to acute or chronic toxicity to aquatic and marine life, impair the biological integrity of aquatic or marine ecosystems, or result in an unacceptable risk to human health.*

2.3.6 Impaired Waters (303(d) and TMDL)

A majority of the stormwater runoff at the Airport discharges to the Connecticut River, listed as an impaired water in the CT 2016 303(d) List. The Airport discharges stormwater to a segment of the river listed as being impaired for "fish consumption" by PCBs and for "recreation" by E. Coli. Potential sources for PCB impairment includes industrial discharges, municipal discharges, landfills, illicit discharges, remediation sites, and groundwater impacts. Potential sources for E. Coli impairment include stormwater, illicit discharges, combined sewer overflows, insufficient on-site treatment/ septic systems, and agricultural activities.

In addition, a Statewide Total Maximum Daily Load Analysis for Bacteria Impaired Waters (TMDL) document, dated September 19, 2012, includes this segment of the Connecticut River.

The official listing of 303(d) Impaired Waters can be found at the following website:

https://www.epa.gov/tmdl/region-1-impaired-waters-and-303d-lists-state#iw-ct

2.3.7 Other NPDES Discharges

The Airport does not currently have any discharges that would require coverage by other NPDES permits (e.g. sanitary wastewater).

2.3.8 Consistency with Other Plans and Permits

The Airport has a Spill Prevention, Control, and Countermeasure Plan (SPCC Plan) prepared pursuant to the U.S. Environmental Protection Agency's (USEPA) Oil Pollution Prevention Regulations (40 CFR Part 112).

The CAA maintenance facility floor drain discharge to the sanitary sewer is authorized by a CT General Permit for the Discharge of Vehicle Maintenance Wastewater (Permit ID #GVM000042) and a General Permit to Limit Potential to Emit from Major Stationary Sources of Air Pollution (Permit ID #075-0308-GPEE).

No other plans or permits are applicable to this SWPPP.

2.3.9 Future Construction

In accordance with Section 5(c)(2)(I) of the General Permit, any activity that disturbs greater than one acre shall be conducted in accordance with the General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities. All construction regardless of size, shall comply with the current Connecticut Guidelines for Soil Erosion and Sediment Control during construction and the current Connecticut Stormwater Quality Manual for the design and implementation of post-construction stormwater management measures.

Wherever possible, the use of copper or galvanized roofing or building materials for any new construction where these materials will be exposed to storm water shall be avoided.

Additionally, in accordance with Section 5(b)(9)(C) of the General Permit, for all industrial activities initiated after July 15, 2003, loading docks shall be protected by a permanent roof or other structure that protects the loading dock from direct rainfall. Stormwater collection and drainage facilities adjacent to the loading dock shall be designed and maintained in a way that prevents any materials spilled or released at the loading dock from discharging into the storm sewer.

2.4 INVENTORY OF EXPOSED AND POTENTIALLY EXPOSED MATERIALS

The following **Table 3** is a list of the types of non-gaseous materials that have been handled, treated, stored or disposed in a manner to allow exposure to stormwater between the time of

three years prior to the date of the issuance of the General Permit and the present, in accordance with Section 5(c)(2)(D)(ii) of the General Permit.

Table 3. Inventory of Exposed and Potentially Exposed Materials

Activity/Exposed Material	Location	Associated Outfall	Cause of Potential Exposure
Heating Fuel	UST (outdoor) State Police	Discharge D	Spill during dispensing
Floor Drain Discharge	Oil/Water Separators & Holding Tanks	Discharges A & B	Spill while pumping out tank
Vehicle/Equipment Fueling Area	Gasoline/Diesel USTs and Dispenser Island – Maintenance Facility (outdoor)	Discharge A	Spill during dispensing
Vehicle/Equipment Fueling Area	Gasoline/Diesel ASTs, – State Police (outdoor)	Discharge D	Spill during dispensing
Aviation Fueling Area	Jet A/Avgas ASTs & Fueling Island – Fuel Farm (outdoor)	Discharge D	Spill during dispensing
Mobile Fueling	Jet A/Avgas Mobile Fuel Trucks (outdoor)	Discharges A & D	Spill during dispensing
General Refuse	Dumpsters (outdoor)	Discharges A, C & D	emptying dumpster
Empty Motor Oil Containers	Lined Dumpster (outdoor)	Discharge D	emptying dumpster
Aircraft Storage	Aprons	Discharges A, C, & D	Uncovered outdoor parking
Vehicle/Equipment Storage	Maintenance Facility (indoor/outdoor) & State Police Storage Area (outdoor)	Discharge D	Uncovered outdoor parking
Material Storage (Waste Oil, Antifreeze)	Maintenance Facility & Hangars (indoor)	Discharges A, B, C & D	Spill while pumping out
Aircraft Deicing Material Storage	FBO Hangars (indoor & outdoor)	Discharges A & D	N/A
RW/TW Deicing Material Storage	Salt Shed (indoor)	Discharge D	During loading/unloading
Deicing Material Application Areas	N/A	N/A	N/A

Source: McFarland Johnson.

3.0 POTENTIAL POLLUTANT SOURCES

Potential pollutant sources are associated with aircraft, vehicle/equipment maintenance, aircraft and vehicle/equipment fueling, vehicle/equipment and material storage areas, and aircraft,

vehicle/equipment cleaning. Industrial activity areas are shown on the Airport Drainage Map (Figure 3).

The Airport's stormwater management system, consisting of swales, oil/water separators, and closed stormwater drainage system, capture stormwater runoff and promote settling of suspended solids. In the event of a major spill, the stormwater management system would minimize the potential pollutants from flowing to surface waters. The stormwater management system will be discussed in more detail in Section 4.7.

The potential pollutants present in the Airport drainage areas and their sources include:

Table 4. Potential Pollutants

Industrial Activities	Pollutant Source	Potential Pollutants
Fueling	Spills and leaks during fuel transfer, "topping off" tanks, runoff from fueling areas, leaking storage tanks	AVGAS Fuel, Heating Fuel, Oil, other Petroleum Hydrocarbons (TPH), Metals
Aircraft Deicing/Anti-icing Operations	Runoff of spent deicing fluids	Biochemical Oxygen Demand (BOD), Glycol compounds
Pavement Deicing/Anti-icing Operations	Runoff of spent deicing fluids	BOD, Nitrogen, Ammonia, Sodium Formate/Acetate Blend (airside), Sand
Vehicle/Equipment, Maintenance, Storage and Cleaning Areas	Spills and leaks during maintenance, disposal of waste parts and spent washwater	Gasoline, Oil, other TPH, Metals
Aircraft Washing	Spent washwater	TPH, Suspended Solids, Metals
Material Handling/Storage Areas	Leaks or spills due to faulty container integrity, disposal of waste products, runoff from outdoor areas	Suspended Solids, Oil & Grease, Metals, Chemical Oxygen Demand (COD), Biochemical Oxygen Demand, Solvents, Deicing material (e.g. sand, salt, ice melt)
Aircraft Maintenance and Storage	Spills and leaks during maintenance, disposal of waste parts	Diesel, Gasoline, Oil, other TPH, Metals
Onsite Waste Disposal Practices	Spills and leaks during removal	Trash, Oil

Source: McFarland Johnson.

Measures to prevent contamination from these potential pollutant sources are addressed in Section 4.0.

3.1 SPILLS AND RELEASES

In accordance with Section 5(c)(2)(D)(iv) of the General Permit, a worksheet listing spills and leaks of five gallons or more of petroleum products, or of toxic or hazardous substances which could affect stormwater that occurred at the facility after the date of three years prior to the effective date of the SWPPP is provided in **Appendix C**.

4.0 STORMWATER CONTROL MEASURES

This section identifies and summarizes BMPs considered in the development and implementation of this SWPPP to minimize the discharge of pollutants from the Airport as discussed in Section 5(b) of the General Permit. The sector specific requirements for control measures relative to industrial activities at a facility with Sector G is covered in Section 4.11 of this SWPPP.

The Airport does not dictate storage requirements to tenants nor are the tenants obligated to disclose storage locations. On an annual basis, the Airport Manager requests that all tenants provide an update to help ensure accurate information regarding all product storage on site.

4.1 GOOD HOUSEKEEPING

Housekeeping includes the maintenance of areas which could contribute pollutants to stormwater discharges. Good housekeeping consists of maintaining a safe, orderly and clean work environment.

In general, the following measures will be used to prevent or minimize contamination of stormwater runoff at the facility:

- Sweeping of runway/apron areas on an as needed basis to remove foreign objects and debris
- Sweeping asphalt/concrete areas on an as needed basis to remove sand and control dust
- Maintain an organized inventory of materials
- Use drip pans when changing fluids
- Removal of waste materials
- Management of garbage and waste
- Routine inspections of vehicles/equipment, drums, tanks and containers for leaks and structural condition
- Prompt cleanup of any petroleum or other liquid spills

4.2 VEHICLE AND EQUIPMENT WASHING

Washwaters from aircraft, vehicle, and equipment cleaning are considered a non-stormwater discharge. In accordance with Section 5(b)(2) of the General Permit, washing or rinsing of equipment, buildings, or vehicles must discharge to sanitary sewer, to a holding tank to be hauled off-site, or through another permitted method.

Cleaning of aircraft is conducted in hangars equipped with floor drains that discharge to oil/water separators and the sanitary sewer. Additionally, cleaning of vehicles and equipment is conducted in the CAA maintenance facility, which is equipped with floor drains that discharge to an oil/water separator and the sanitary sewer.

4.3 FLOOR DRAINS

In accordance with Section 5(b)(3) of the General Permit, all floor drains must be sealed, authorized by a local authority to discharge to sanitary sewer, or are allowable if considered a Non-Stormwater Discharges as discussed in the Signatures and Certifications section of this SWPPP.

Floor drains are located in most conventional hangars and CAA's maintenance facility. Floor drains discharge to oil/water separators and the sanitary sewer.

4.4 ROOF AREAS

In accordance with Section 5(b)(4) of the General Permit, roof areas that are subject to drippage, dust or particulates from exhausts or vents or other sources of pollution must be inspected to determine if any potential sources of stormwater pollution are present. If so, the permittee must minimize such sources or potential sources of pollution.

The restaurant located on Airport property has the potential to discharge oil and grease in particulates from the exhaust. The restaurant exhaust should be equipped with a grease catcher or similar and maintained to prevent potential pollutant runoff into the stormwater management system.

4.5 MINIMIZE EXPOSURE

In accordance with Section 5(b)(5) of the General Permit, the following BMPs are implemented to minimize the exposure of industrial activities to rain, snow, snowmelt, and runoff:

- Fluid containers with valves shall be maintained in a closed and locked position;
- Drums containing liquids, especially oil and lubricants, stored indoors; shall be stored in overpack containers or spill pallets; or in similar containment devices;
- Leaky or leak-prone vehicles/aircraft/equipment awaiting maintenance shall be stored indoors, if possible. Drip pans or equivalent measures shall be placed under any leaking piece of aircraft, vehicle, or equipment until the leak is repaired. Drip pans shall be inspected for leaks and potential overflow and all liquids will be properly disposed of at a permitted facility;
- All ASTs associated with industrial activities with the potential to impact surface waters have secondary containment;
- Loading/unloading areas associated with the AVGAS AST have secondary containment;
- Spill cleanup kits will be located, if not already, near fueling areas and maintenance areas; and
- Vehicle and equipment cleaning are not conducted outside.

4.6 SEDIMENT AND EROSION CONTROL

The principal potential source for soil erosion can occur during ground disturbance, and maintenance and construction activities. Normally the Airport contains few, if any, exposed areas that would be subject to erosion and/or sediment runoff. The dominant soil type on the property where industrial activities are located are Udorthents - Urban land complex, which has a low runoff potential and high infiltration rates. A Natural Resources Conservation Service Web Soil Survey map illustrating soils on the Airport property is included in **Appendix F**.

Discharge of stormwater and dewatering wastewaters to surface waters from construction with soil disturbance of one or more acres must obtain coverage under the CT DEEP General Permit for the Discharge of Stormwater and Dewatering Wastewaters Associated with Construction Activities. Erosion and sediment controls for future construction projects will be implemented in accordance with the current Connecticut Guidelines for Soil Erosion and Sediment Control and the current Connecticut Stormwater Quality Manual. Preparation and submittal of a permit registration form is also required.

The following BMPs are incorporated at the Airport to stabilize exposed areas and contain runoff to minimize onsite erosion and potential off-site discharges of sediment:

A. Non-Structural BMPs

- Conduct routine inspections of areas susceptible to erosion and properly maintain all erosion and sedimentation control practices.
- Prior to grading or clearing, stabilize steep slopes, areas adjacent to waters of the United States, and the site perimeter to prevent erosion and sediment transport into receiving waters and onto adjacent properties and roadways.
- Prior to grading or clearing, provide and maintain designated, stabilized site access for vehicle entry/egress or otherwise prevent vehicle trackout of sediments.
- Minimize site disturbance and vegetation clearing.
- Preserve vegetated buffer areas adjacent to waters of the United States and on steep slopes.
- Upon completion of grading or clearing, thoroughly sweep sediment from paved areas (either manually or using a mechanized street sweeper, vacuum preferable).

B. Structural BMPs

- Reduce runoff velocities, both on slopes and at discharge points, to prevent erosion.
- Vegetated and riprap swales are in place to intercept sediment-laden runoff and facilitate settling or filtering of sediments.
- Drainage swales have flow velocity dissipation devices at the outfalls.

4.7 MANAGEMENT OF RUNOFF

The Airport is equipped with stormwater management practices, which direct stormwater runoff to the Connecticut River or MDC operated stormwater drainage system. Due to the Airport's location along the Connecticut River, the stormwater drainage system is influenced by tidal

fluctuations and often becomes flooded during rain events. Drainage areas and stormwater monitoring points are shown on the Airport Drainage Map, **Figure 3**.

In order to minimize pollutants in stormwater discharges, runoff management measures at the Airport consist of swales, stormwater piping, catch basins, and oil/water separators to capture sediment and pollutants, reduce runoff and prevent or minimize pollutant runoff from entering waters of the United States.

1. Drainage Area A

Drainage Area A, approximately 25.9 acres in size, generally slopes in an easterly direction. The majority of stormwater in the drainage area flows overland from the northern portion of Runway 2-20, associated taxiways and maintained airfield areas, the aircraft tie-down areas west of Runway 2-20, a portion of the FBO hangar (H1), and the restaurant. The drainage area includes run-on from off-site stormwater from the US Postal Service building and parking area located west of the Airport. Stormwater flows into an existing closed stormwater management system that flows east and discharges to the Connecticut River. The stormwater discharge point for Drainage Area A is located at the outlet to the river. The stormwater discharge point is also considered the representative drainage area, identified as sampling point (DSN-001).

2. Drainage Area B

Drainage Area B is approximately 127.1 acres and includes the southern portion of Runway 2-20, the eastern half of Runway 11-29, associated taxiways and maintained airfield area, helipads, and T-hangars. Stormwater in the drainage area flows overland into an existing closed stormwater management system that flows south and discharges to the Connecticut River near the southeastern corner of the Airport property. The stormwater discharge point for Drainage Area B is located at the outlet to the river.

3. Drainage Area C

Drainage Area C is approximately 65.7 acres and includes the western end of Runway 11-29, associated airport taxiways and maintained airfield, aircraft tie-down areas, and airport buildings, such as the control tower, conventional hangars, and T-hangars. The majority of stormwater in the drainage area flows overland into an existing closed stormwater management system, which is connected to the MDC operated storm sewer. The drainage area includes stormwater runoff from off-airport property west of the Airport. The off-site stormwater run-on land use consists of Murphy Road and commercial and industrial businesses located on the east side of Murphy Road. The stormwater discharge point for Drainage Area C is located at the outlet to the MDC system south of Runway 11 end along the access road to the MDC Water Pollution Control Plant.

4. Drainage Area D

Drainage Area D covers approximately 27.8 acres of the northern portion of the airport. Drainage Area D includes CAA maintenance facility buildings, the CT State Police facility, FBO fuel farm, FBO hangar (H1), aircraft tie-down areas, and other various airport buildings. Drainage Area D also

includes stormwater runoff from off-airport property. The drainage area includes stormwater run-on from public utility and commercial land uses located between Murphy Road and Lindbergh Drive. Stormwater flows overland into an existing closed stormwater management system that connects to the MDC operated storm sewer on Maxim Road. The stormwater discharge point for Drainage Area D is located at the outlet to the MDC system on Maxim Road. The stormwater discharge point for Drainage Area D is also considered the representative drainage area, identified as sampling point (DSN-002).

4.8 DUST GENERATION AND VEHICLE TRACKING

The Airport does not normally generate dust, nor does off-site tracking of raw, final, or waste materials occur. Sweeping is performed on an as needed basis to remove sand used for deicing. Other potential dust and/or off-site tracking of raw, final, or waste materials would be associated with Airport construction projects and would be covered by a CT DEEP General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities and/or BMPs, such as, regular sweeping and construction entrances.

4.9 SALT STORAGE

CAA or its tenants do not store salt on site.

4.10 PREVENTATIVE MAINTENANCE

CAA and tenants will regularly inspect, test, maintain, and repair all industrial equipment and systems to prevent leaks, spills, and other releases of pollutants in stormwater discharges. All areas to be inspected for preventative maintenance are included in the Routine Inspections as discussed in Section 5.2 of this SWPPP.

Maintenance of BMPs identified in this SWPPP must be maintained in effective operating condition. If inspections indicate that control measures need to be replaced or repaired, the necessary repairs or modifications must be made as expeditiously as practicable.

BMPs will be maintained in accordance with the standards and specifications for each specific control measure. Specifically, the minimum maintenance requirements for typical BMPs are as follows:

- Catch Basins – Inspect to ensure catch basins are operating efficiently. Remove sediment when 60% of the sump depth has been filled or sediment is within 6 inches of the bottom of the outlet pipe.
- Grass/Rock Lined Swales – Remove sediment and debris from swales. Mow vegetated swales and remove woody vegetation. Repair dislodged or unstable rock. Stabilize eroded or undercut areas.
- Oil/Water Separators – Inspect area served by oil/water separator for spills or leaks. Clean according to manufacturer's recommendations or when sludge accumulates to 20 percent

of the distance between the separator base and static liquid level. Cleaning should be conducted by a certified waste hauler and disposed of in accordance with state regulations.

- Outfalls – Outfalls should be inspected for debris inhibiting the flow of water and debris should be removed immediately. Riprap outlets should be inspected for evidence of scour beneath the riprap or for dislodged stones; repairs should be made immediately.

In addition to the above, preventative maintenance will include the visual inspection and/or testing of onsite equipment and systems to identify conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters; and the appropriate maintenance of such equipment and systems.

4.11 SECTOR SPECIFIC STORMWATER CONTROL MEASURES

The control measures discussed in this section will be implemented to address sector-specific requirements to prevent or minimize the contamination of stormwater associated with industrial activities at the Airport.

Aircraft, Ground Vehicle and Equipment Storage

Aircraft at the Airport are stored on the aprons or in hangars. CAA ground vehicles or equipment are stored in the maintenance facility and surrounding paved parking area, and in the vicinity of the salt shed located on the northern portion of the Airport property. In addition, CT State Police store vehicle/equipment in the outdoor storage yard located on the northeastern portion of the Airport property. Additional CAA snow removal equipment is stored in the former Firehouse building, located south of the FBO hangars. Miscellaneous CAA equipment/vehicles are stored in a parking area north of the Northwest Ramp. Mobile fuel trucks are stored on the GA Ramp near the FBO Hangar (H1).

The following BMPs are implemented to prevent or minimize contamination from aircraft, vehicle and equipment storage areas:

- Leaky or leak-prone vehicle/aircraft/equipment awaiting maintenance will be stored indoors, if possible. If the vehicle/aircraft/equipment cannot be moved indoors, measures will be taken to minimize stormwater runoff to nearby drainage structures.
- Dry cleanup methods are used for spills and leaks.
- Installation of berms/dikes around storage areas, if possible.
- Drip pans are used for the collection of vehicle and equipment leaks.

Fueling Areas

The greatest concern with aircraft fueling is the potential for spills migrating to the stormwater drainage system and discharging to surface waters of the state. Spills usually originate from topping-off or overfilling of aircraft. The major constituents of aircraft fuels are petroleum hydrocarbons.

CAA owns the fuel tanks and pumps, which are located on the northwest side of the Airport along Lindberg Drive. However, Hartford Jet Center leases the tanks and provides the fuel services to aircraft. Currently, the FBO and/or tenants store and use petroleum products. Petroleum products consist of the following:

Table 5. Potential Pollutants

Fuel Type	Volume (gallons)	Location	Operator
Jet A Fuel	12,000 AST	Fuel Farm (covered/outdoor)	FBO
Avgas Fuel	12,000 AST	Fuel Farm (covered/outdoor)	FBO
Jet A Fuel	2,200 & 2,600 ASTs	Mobile Fuel Trucks	FBO
Avgas Fuel	2-1,000 ASTs	Mobile Fuel Trucks	FBO
Gasoline	4,000 UST	CAA Maintenance Hangar (outdoor)	CAA
Diesel	4,000 UST	CAA Maintenance Hangar (outdoor)	CAA
Heating Oil	5,000 UST	Firehouse Building (outdoor)	CAA
Diesel	250 AST	Generator (near Aviation School)	CAA
Waste Oil	275 AST	CANG (outdoor)	CANG
Diesel	300 AST	Generator (east of Lindbergh Dr/Maxim Rd intersection)	CAA
Gasoline	6,000 UST	Maintenance Garage (outdoor)	CAA

Source: McFarland Johnson and SPCC Plan.

Spill cleanup of petroleum relative to these tanks is covered in Section 4.12. Loading and Unloading Areas are discussed in the following section.

Aircraft fueling is performed outdoors on the aprons by the FBO. The FBO operates a traditional fuel service to transient aircraft. Aircraft fuels are stored at the fuel farm located north of the FBO hangar (H1), as shown on the Airport Drainage Map, **Figure 3**. CAA owns the fuel tanks and pumps at the fuel farm and the FBO leases the tanks and provides the fuel services to aircraft. The fuel farm ASTs are located in a concrete containment area equipped with an emergency shut-off and

sump pump connected to an oil/water separator. The fuel storage tanks are inspected on a daily basis and maintained to prevent corrosion/rust.

In addition, the FBO operates mobile fuel trucks, consisting of two Jet A, 2,200-gallon and 2,600-gallon, and two Avgas fuel, both 1,000-gallons. The mobile fuel trucks are parked on the apron near the FBO hangar (H1). These vehicles should be monitored daily by trained individuals for leaks. Spill kits are located on the fuel trucks.

Vehicle and equipment fueling is conducted near the CAA maintenance facility. FBO vehicle and equipment fueling, including mobile fuel trucks, is conducted at the fueling area behind the CAA maintenance facility.

Spill cleanup materials should be located near all fueling areas and on mobile fuel trucks for quick spill response. Dry cleanup methods, such as loose absorbent or absorbent pads, are located near the fuel dispensing area and if used are collected and are disposed of properly.

Loading and Unloading Areas

CAA personnel and/or tenants are present to witness AST product deliveries or waste removals. Appropriate facility personnel are present to monitor these activities to ensure that the product transfer is accomplished without a release. If an unattended product delivery occurs, appropriate site personnel will visit the product delivery or waste removal area as soon as possible to check that everything is in order (no evidence of releases or overfills, all caps, and manhole covers are properly returned, etc.).

The maintenance facility fuel dispensing island is a potential pollutant source as a result of possible spills and overfills during fueling operations. The fueling apparatus are inspected regularly in order to comply with state regulations.

The oil/water separator and/or holding tanks are a potential pollutant source as a result of possible spills while pumping out the tanks. Oil/water separators and holding tanks are inspected regularly in order to comply with state regulations.

The loading/unloading operations for mobile fuel trucks has the potential to be a pollutant source as a result of possible spills and overfills. The transfer of fuel to mobile fuel trucks is conducted on an impervious pad.

Spill cleanup materials should be readily available in loading/unloading areas. If feasible, spill and overflow practices (e.g., drip pans, drip diapers, and/or other containment devices) will be placed beneath fuel oil connectors to contain potential spillage during deliveries or from leaks at the connectors.

CAA personnel and appropriate tenants are trained to clean up any spills using dry methods.

Aircraft, Ground Vehicle and Equipment Cleaning

CAA vehicle/equipment washing is conducted at the CAA maintenance facility. In addition, aircraft washing is performed in Hangars 1, 2, and 3 by the FBO. Washwaters drain to oil/water separators

which are connected to the sanitary sewer. Oil/water separators are inspected regularly and maintained.

Aircraft, Ground Vehicle, and Equipment Maintenance

Vehicle and equipment maintenance is conducted at the Airport by the CAA in the maintenance facility. Aircraft maintenance is performed by Hartford Jet Center, VIP Avionics, Excel Avionics, and CT Aero Tech School, in hangars as shown on the Stormwater Features Maps. CAA and tenant(s) implement the following measures to prevent or minimize the contamination of stormwater runoff from aircraft maintenance areas:

- Maintenance activities are performed indoors, where feasible.
- Fluids from parts are drained prior to disposal.
- Used fluids are transferred promptly to their appropriate container.
- Drip pans or equivalent measures will be placed under any leaking piece of equipment until the leak is repaired. Drip pans will be inspected for leaks and potential overflow and all liquids will be properly disposed at a permitted facility.
- Aprons or hangar floors are not hosed down.
- An organized inventory of materials used in maintenance areas is maintained.
- Spill prevention and response measures are implemented (see Section 4.12).
- Dry cleanup methods are used.
- Materials are stored in appropriate containers.

Runway Deicing Operations

Runway deicing activities are conducted with the use of FAA approved sand and Sodium Formate/Acetate as necessary to deice active runways during operations.

Aircraft Deicing/Anti-icing Operations

Deicing/anti-icing operations protect aircraft from ice and snow build-up during inclement weather. Deicing is performed as necessary at the Airport during the winter season (October through April). The deicing/anti-icing season is entirely weather dependent.

Glycol compounds have the potential to increase the BOD in receiving waters. The use of deicing chemicals presents a high potential for oxygen deprivation of stormwater during winter months. Aircraft deicing is conducted on the FBO Ramp.

Deicing fluid runoff is captured by the FBO Ramp closed stormwater drainage system and directed to the closed stormwater management system and ultimately discharged to the MDC combined sewer/stormwater system.

4.12 SPILL PREVENTION AND RESPONSE PROCEDURES

CAA and Airport tenants take measures to minimize stormwater contamination at loading/unloading areas, fueling areas, aircraft, vehicle and equipment storage areas and from equipment or container failures. Wet cleanup practices are prohibited where the practice would result in the discharge of pollutants to the stormwater drainage system.

This section describes a set of procedures to be followed in the event of a spill. These procedures are not intended to encompass all aspects of any spill that could possibly occur; rather, they have been developed for use as a guide for persons involved in control and countermeasure operations. In the event of a release, a swift response is important for the protection of both facility personnel and the environment. However, the responsibility of facility personnel to respond to a spill is based on multiple factors, including:

- The level of employee training.
- The nature of the spill.
- The quantity of material spilled.
- The type of material spilled.
- The proximity of facility personnel relative to the immediate release area.

Before describing the procedures to be taken in response to a spill, the following definitions must be understood. These definitions are an integral part of the spill response procedures.

• Release:	Any discharge, spillage, uncontrolled loss, seepage, infiltration, leakage, injection, escape, dumping, pumping, pouring, emitting, emptying, or disposal of a hazardous or toxic substance[1].
• Immediate Release Area:	A fifty-foot radius around the release.
• Incidental Release:	A release of any hazardous or toxic substance that can be absorbed, neutralized or otherwise controlled at the time of release by employees in the immediate release area.
• Uncontrolled Release:	Any release that is determined not to be an incidental release.

Spills in exposed areas of the facility must be documented on the Spill Log Form (see **Appendix C**).

4.12.1 Spill Response Procedures

In the event of a release, the facility personnel who first notice the release must evaluate the nature and extent of the release to determine if the release is "incidental" or "uncontrolled".

Incidental Release Response Procedures

Facility personnel:

- Absorb, neutralize, or otherwise control the release using the available solid absorbent materials.
- Determine if additional response help is necessary.

[1] Hazardous or toxic substances are defined in Section 22a-430-4 of the Regulations of Connecticut State Agencies

- Collect any used absorbent material and place the collected material in the dedicated container.
- Replace spill response materials as necessary.

Immediately after an emergency event has been detected, proper notifications will be made.

Table 6. Incidental Release Emergency Contacts

Name/Title	Contact Information
PPT Program Coordinator	(860) 254-5634
Airport Coordinator	(203) 264-8010 (860) 818-5848
CT DEEP - Oil and Chemical Spill Response Division	(860) 424-3338 (866) 337-7745

Source: CAA and McFarland Johnson.

- If additional response help is deemed necessary, immediately bring to the attention of the PPT Program Coordinator. The PPT Program Coordinator will contact an approved cleanup contractor to assist in the release response.

- Upon completion of the spill response, notify the PPT Program Coordinator. They will make the necessary arrangements to have the waste material transported and disposed by an authorized waste handler.

Uncontrolled Release Response Procedures

Facility personnel should take no response actions beyond the following:

- Call 911 to initiate emergency response.
- Sound fire alarm to initiate evacuation from the area of the release, if applicable.
- Stop all work immediately.
- Shut off all equipment.
- Evacuate the immediate area and assemble at designated emergency meeting location(s).
- Determine if any personnel require immediate medical attention and contact medical professionals as necessary.
- Follow the instructions of the Pollution Prevention Team member or designated representative.
- Update local, state, or federal responders on the status of all personnel and site conditions as they arrive.

The Pollution Prevention Team member shall Immediately notify the following listed in **Table 7**:

Table 7. Uncontrolled Release Emergency Contacts

Name/Title	Contact Information
City or Town Emergency Coordinator	911
PPT Program Coordinator	(860) 254-5634
Airport Coordinator	(203) 264-8010 (860) 818-5848
CT DEEP - Oil and Chemical Spill Response Division	(860) 424-3338 (866) 337-7745

Source: CAA and McFarland Johnson.

4.13 EMPLOYEE TRAINING

Personnel training is an essential key in achieving the objectives of the SWPPP. Facility personnel, who are responsible for stormwater pollution prevention, including the PPT, or those who work in areas where industrial activities are exposed to stormwater, must be trained within ninety (90) days of employment and at least once a year thereafter. Training will address the following subjects:

- Components and goals of the SWPPP
- Facility spill response procedures
- Inspection requirements
- Control measures
- Fueling procedures
- Good Housekeeping Practices
- Emergency equipment location
- Materials management procedures

An Employee Training Form will be used to document the training and will be kept with the SWPPP (see **Appendix D**).

5.0 INSPECTION, MONITORING, REPORTING AND RETENTION OF RECORDS

Following the requirements of the General Permit, the permittee must perform and document four types of monitoring including:

1. Semi-Annual Comprehensive Site Inspection
2. Routine Monthly Inspection
3. Visual Quarterly Monitoring
4. Benchmark Monitoring (General & Sector Specific)

The requirements for each of these types of monitoring follow.

All completed monitoring forms, reports and miscellaneous documentation (i.e. DEEP correspondence and BMP information) shall be kept in the appropriate SWPPP appendices. All records of inspections will be maintained for a minimum of five (5) years.

5.1 SEMI-ANNUAL COMPREHENSIVE SITE INSPECTION

At least twice each year, the PPT or other qualified personnel will conduct a site inspection and evaluation of the facility during periods of actual de-icing operations and during rain events, if possible. Qualified personnel are described as a person familiar with the content, requirements and objectives of the permit and the facility's SWPPP.

5.1.1 Scope

The Semi-Annual Comprehensive Site Inspection must include all areas where industrial materials or activities are exposed to stormwater. In general, the Semi-Annual Comprehensive Site Inspection will include the inspection in the following areas for evidence of, or the potential for, pollutants entering the drainage system, which may or may not be applicable to this specific Airport:

- Material handling areas;
- Material and chemical storage areas;
- Vehicle/equipment storage, and cleaning areas;
- Fueling areas;
- Loading/unloading areas;
- Aircraft maintenance areas;
- Aircraft deicing areas;
- Leaks or spills from industrial equipment, drums, tanks, and other containers;
- Roof areas;
- Structural stormwater management measures;
- Erosion control measures; and
- Spill response equipment.

Stormwater BMPs identified in the SWPPP must be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they must be inspected to see whether BMPs are effective in preventing significant impacts to receiving waters. Where discharge locations are inaccessible, nearby downstream locations can be inspected.

5.1.2 Semi-Annual Comprehensive Site Inspection Report

Upon completion of the Semi-Annual Comprehensive Site Inspection, the Airport will document the inspections with an inspection report (see **Appendix E-1**). The report will include:

- Scope of the inspection (i.e. areas/activities inspected)

- Names of inspection personnel
- Inspection date
- Major observations relating to the SWPPP
- Location of any BMPs that need to be maintained
- Actions taken

The evaluation reports will be retained with the SWPPP for at least five years. The inspection report must be signed by the permittee or a duly authorized representative. When inspection schedules overlap, this Semi-Annual Site Inspection may be used as one of the more frequent inspections discussed below.

5.2 ROUTINE MONTHLY INSPECTION

Preventive maintenance at the facility includes regular inspection and maintenance of areas, which could contribute to pollutants entering stormwater. At a minimum, CAA, or its designee, will perform regular monthly inspections during the months when deicing/anti-icing activities occur, if applicable. The monthly inspections will include assessment of the following, where applicable:

- Deicing/anti-icing activities, if applicable,
- Housekeeping of the facility,
- Storage tanks, drums and other storage containers for leaks or maintenance deficiencies,
- Perimeter of the property for improper discharges of liquids,
- Areas where there is significant storage of liquid materials,
- Evaluate the performance and operation of all stormwater management devices and BMPs, such as catch basins, drainage swales, and inlet protection,
- Aircraft, vehicle/equipment maintenance storage, cleaning and fueling areas,
- Material storage areas, and
- Loading/unloading areas.

Any abnormal conditions found by employees will be immediately brought to the attention of the PPT Team Leader or designated representative. All results of the monthly inspection will be recorded on the Routine Monthly Inspection Form (see **Appendix E-2**).

5.3 VISUAL QUARTERLY MONITORING

CAA, or a qualified consultant, must complete a quarterly visual examination of a stormwater discharge from the outfalls identified on the Airport Drainage Map (see **Figure 3**). In addition, the outfalls for Drainage Areas A through D will be marked in the field with signage indicating the outfall identifier.

The examination(s) must be made at least once in each of the following three-month periods: January through March, April through June, July through September, and October through

December. No analytical tests are required to be performed on the samples for the purpose of meeting the visual monitoring requirements. The examination must document observations of:

- Color
- Odor
- Clarity
- Floating solids
- Settled solids
- Suspended solids
- Foam
- Oil sheen
- Any other obvious indicators of stormwater pollution

If the visual examination indicates the presence of stormwater pollution (e.g., color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other indicators), the CAA or qualified consultant must evaluate the facility for potential sources of stormwater contamination. If the assessment proves that the control measures are inadequate or not being properly operated and maintained, the permittee must review and revise, as appropriate, the selection, design, installation and implementation of the control measures to ensure that the condition is eliminated to prevent re-occurrence.

A Visual Quarterly Monitoring Form is included in **Appendix E-3** and completed forms will be kept onsite with the SWPPP.

The report must include the outfall location, the assessment date and time, assessment personnel, the nature of the discharge (e.g., runoff or snow melt), visual assessment of the stormwater discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of stormwater pollution), probable sources of any observed stormwater contamination, actions taken to eliminate these sources and documentation of reasons if unable to collect a representative sample.

5.4 BENCHMARK MONITORING

Due to the classification of this facility, annual stormwater monitoring will be required during the deicing season. The levels of each parameter in the general monitoring results will be compared to the benchmark levels. Below is a list of the parameters that must be tested.

Table 8. General Monitoring Requirements

Pollutants of Concern	Benchmark Level
Chemical Oxygen Demand (COD)	75 mg/L
Oil and Grease	5 mg/L
Total Suspended Solids	90 mg/L
Total Phosphorous	0.4 mg/L

Total Copper	0.059 mg/L
Total Lead	0.076 mg/L
Total Zinc	0.160 mg/L
Nitrate as Nitrogen	1.10 mg/L
Total Kjeldahl Nitrogen	2.30 mg/L
pH	within the range 5.0 to 9.0 s.u.

Source: CT DEEP GP-14. Section 5(e).

In addition to these parameters, there are parameters specific to small Airports that must be tested for. The following must be tested for during the first two years of the permit, if used on site:

Urea (mg/l)

Propylene Glycol (mg/l)

Ethylene Glycol (mg/l)

The analysis of the results obtained and the steps taken given the tests results are explained in Section (5)(e)(B) of Appendix A of the General Permit. If the value of the parameter in the monitoring results is lower than the benchmark, then testing is no longer required for that parameter. The above additional parameters specific to small Airports will be monitored during the first two years of the permit, and they are not subject to benchmark requirements.

The General/Benchmark monitoring may be conducted in conjunction with the Visual Quarterly Monitoring.

Annual aquatic toxicity monitoring will be required during the first two years following the date of authorization of the GP.

5.4.1 Monitoring of Discharges to Impaired Waters

The facility discharges to one CT DEEP established impaired water, the Connecticut River. Additional annual monitoring of the stormwater discharges to the impaired waters is required for the cause of the impairment, E. Coli and PCBs.

The most recent round of water quality sampling conducted for the Airport was completed on June 4, 2008. The results are included in **Table 9**. The samples were collected from the outfalls that discharge stormwater from Drainage Areas A and B to the Connecticut River. Since the state benchmarks for the respective parameters were not exceeded in either sample, no further sampling has been conducted.

Table 9. Airport Storm Water Sampling Results – June 2008

Parameter	Analytical Method	Benchmark	Outfall A	Outfall B	Outfall D
Oil & Grease	EPA 1664	5.0mg/l	<1.4 mg/l	<1.4 mg/l	<1.4 mg/l
pH	pH Meter	5-9 S.U.	5.87 S.U.	5.19 S.U.	5.64 S.U.
COD	EPA 410.4	75 mg/l	53.8 mg/l	30.5 mg/l	42.1mg/l
Total Suspended Solids	SM 2540 D	90 mg/l	15.0 mg/l	9.0 mg/l	13.0 mg/l
Total Phosphorus	SM 4500-P E	0.40 mg/l	0.21 mg/l	0.1 mg/l	0.16 mg/l
Total Kjeldahl Nitrogen	SM 4500-NO	2.30 mg/l	1.06 mg/l	<0.1 mg/l	<1.0 mg/l
Nitrate Nitrogen	SM 4500-NO3F	1.10 mg/l	0.1 mg/l	0.09 mg/l	0.09 mg/l
Total Copper	EPA 200.7	0.059 mg/l	<0.01mg/l	<0.01 mg/l	<0.015 mg/l
Total Zinc	EPA 200.7	0.160 mg/l	0.04 mg/l	0.047 mg/l	0.041 mg/l
Total Lead	EPA 200.7	0.075 mg/l	<0.015 mg/l	<0.015 mg/l	<0.015 mg/l
24-Hour LC_{50}	EPA-821-R-02	n/a	>100%	>100%	>100%
48-Hour LC50	EPA-821-R-02	n/a	>100%	>100%	>100%

< - Concentration less than analytical equipment detection limit
mg/l – Milligrams per liter
S.U. – Standard units

As part of a Benchmark Monitoring sampling event, the sampling collector will complete a field data collection form. Analytical results must be entered on a Stormwater Monitoring Report (SMR) form and submitted to CT DEEP within 90 days of the sample collection. Copies of a SMR and sample field data collection form are provided in **Appendix E-4**. The field data forms should be combined with the individual laboratory reports and maintained in **Appendix E-4** of this SWPPP and retained for a five-year period.

5.5 RECORDKEEPING

The Airport must retain the SWPPP, monitoring records, corrective actions, and other implementation activities, at the Airport administrative offices for a minimum of five (5) years following the date of expiration of the General Permit or after coverage under the permit terminates. The SWPPP and monitoring records should be accessible, complete, and up-to-date to demonstrate compliance with the conditions of the General Permit.

Typical additional documentation includes, but is not limited to, the following:

- Permit records – copies of registration form and letters from CT DEEP.
- Spill records.
- Employee training records.
- Maintenance records - copies of maintenance and repair of control measures, catch basin cleaning, etc.

- Inspection records – copies of routine facility inspection reports, quarterly visual assessment reports, and semi-annual comprehensive site inspection reports.
- Monitoring – records of sampling results including data collection forms and lab results.
- Corrective actions – records of corrective actions and follow-up activities conducted to demonstrate compliance with the permit.

DISCHARGE NOTIFICATION FORM TO POTW AUTHORITY for the

General Permit for Discharges from Miscellaneous Industrial Users (MIU GP) (refer to the instructions)

1. Facility Information:

a. Facility Name: **Hartford-Brainard Airport**

Address: **233 Maxim Road**

City/Town: **Hartford** State: **CT**

b. Contact Person Name: **Bill Borowiec**

Email Address: **BBorowiec@ctairports.org** Phone Number: **860-254-5882**

Mailing Address: **334 Ella Grasso Turnpike, Suite 160**

City/Town: **Windsor Locks** State: **CT**

c. Owner of parcel (as listed in Tax Assessor's office): **Connecticut Airport Authority**

Email Address: **KDillon@ctairports.org** Phone Number: **860-292-2054**

Owner Mailing Address: **Bradley International Airport, Administrative Office, Terminal A, 3rd Floor**

City/Town: **Windsor Locks** State: **CT**

2. Name of Receiving POTW (NPDES Permit Holder): **Hartford MDC WPCF**

3. This form is being submitted to (check all that apply):

- ☐ Provide notice of Group I Process Wastewater Discharges with cum. max flow ≥ 1000 gpd and < 25,000 gpd
- ☐ Provide notice of Group II Non-process Wastewater Discharges with cumulative max daily flow ≥ 5,000 gpd
- ☒ Provide notice of any Vehicle Maintenance Wastewater discharges
- ☐ Modify or correct previously provided information (for example, change in flow, chemistry, or ownership)
- ☐ Provide notice that a wastewater will be transported by a vehicle to a POTW
- ☐ Request a variance to meet applicable POTW Authority's limits or effluent limits of Section 5(a) of the MIU GP

4. a. Was the Discharge(s) previously authorized by a permit issued by CTDEEP:

☐ No ☒ Yes. Permit No. **GVM001667** (attach copy of authorization/registration certificate)
If "yes", have any changes to the discharge type/chemistry/volume occurred (explain):

b. Date discharge began or will begin: **Ongoing**

5. If any of the following conditions exist, (check all that apply), skip 6 & 7 below and complete 8 below and Attachment A:

- ☒ The discharge is Vehicle Maintenance Wastewater
- ☐ For Process Wastewater Only, the cumulative max daily flow ≥ 1000 gpd and < 25,000 gpd ***AND any of the following apply:***
  - ☐ Discharge has or could have BOD or TSS in excess of 600 mg/L
  - ☐ Is transported by vehicle to the receiving POTW
  - ☐ Has an increase in flow or change in chemistry since the most recent registration/notification
  - ☐ Requires a variance under Section 7(a) of the MIU GP to meet the applicable POTW Authority's limits or effluent limits of Section 5(a) of the MIU GP - ***Requires completion of Attachment D and prior written approval of POTW Authority.***
  - ☐ Requires treatment prior to discharge to meet the applicable POTW Authority's limits or effluent limits of Section 5(a) of the MIU GP.

6. **This Discharge is for (check all that apply):**

   a. **Up to 25,000 gallons per day (cumulative maximum daily flow) of Group I Process Wastewater from: (indicate maximum daily flow for each)**

☐	Commercial laundry	gpd	☐	Non-destruct testing	gpd
☐	Cutting/grinding	gpd	☐	Printing/photo processing	gpd
☐	Food processing	gpd	☐	Reverse osmosis reject	gpd
☐	Brewing/distilling	gpd	☐	Tumbling/cleaning	gpd
☐	Other (describe):	gpd	☐	Water treatment	gpd

Total Flow from all Group I Process Wastewater Discharges: _____gpd

   b. **Discharges of Group II Non-Process Wastewater from: (indicate max daily flow for each)**

☐	Air compressor condensate/blowdown	gpd	☐	Hydrostatic pressure testing	gpd
☐	Boiler blowdown	gpd	☐	Non-contact cooling	gpd
☐	Building maintenance	gpd	☐	Potable water system maintenance sampling	gpd
☐	Fire suppression system testing	gpd	☐	Swimming pool	gpd
☐	Other, including wastewater transported by vehicle (describe): _____				gpd

Total Flow from all Group II Non- Process Wastewater Discharges: _____gpd

7. **Discharge duration:**

   ☐ Continuous (hrs/day) _____ ☐ Intermittent; Frequency of discharge: _____

   More detail (e.g., day(s) of week, time(s) of day): _____

8. **Each of the following POTW Authorities have been provided copies of this notification form in addition to the receiving POTW:** Hartford MDC WPCF

Attachments

☒ Attachment A—**Detailed Discharge Information**—if required by question 5, above.
☐ Attachment B—**Qualified Professional Certification for Treatment**—see Section 4(c)(3)(B) of the MIU GP
☐ Attachment C—**Discharge Analysis** For existing discharges of **Group I Process** and **Group II *Other* non-process wastewater only**, one screening analysis from the testing of a sample taken within 90 days of notification for pollutants specified by Section 5(b)(1) of the MIU GP, shall be submitted with the notification form.
☐ Attachment D—**Request for Variance**—***Prior approval required by POTW Authority.***
☐ Attachment E—**Additional Information**—if required by POTW Authority.

9. **Industrial User Certification**— "I hereby certify that I am making this certification in connection with a notification under the General Permit for Discharges from Miscellaneous Industrial Users, submitted to each applicable POTW Authority for an activity eligible for authorization under such permit. I certify that the notification submitted pursuant to such general permit is on complete and accurate forms as prescribed by the Commissioner without alteration of their text. I certify that I have personally examined and am familiar with the information that provides the basis for this certification, including but not limited to all information described in Section 3(b)(14)(A) of such general permit, and I certify, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining such information, that the information upon which this certification is based is true, accurate and complete to the best of my knowledge and belief. I further certify that I have made the affirmative determination required in accordance with Section 3(b)(14)(B) of such general permit and that my signing this certification constitutes conclusive evidence of my having made such affirmative determination. I also understand that knowingly making any false statement in the submitted information and in this certification may be punishable as a criminal offense, including the possibility of fine and imprisonment, under section 53a-157b of the Connecticut General Statutes and any other applicable law. By entering my name below, I agree that I am providing my legal signature, and am legally bound by the certifications above."

General Permit for Discharges from Miscellaneous Industrial Users (MIU GP)

ATTACHMENT A to Notification Form
(Detailed Discharge Information)

Industrial Users who checked a box for question 5 in the Notification Form must complete this form. Please use the instructions while completing this form.

Part I. General Information

1. **Facility Name (from page 1 of Notification Form): Hartford-Brainard Airport**

2. **Engineer(s) or other consultant(s) employed or retained to assist in preparing the notification or in designing or constructing the activity.**

   Name:

   Mailing Address:

   City/Town: State: Zip Code:

   Business Phone: ext.:

   Contact Person: Phone: ext.

   E-mail:

   Service Provided:

For POTW USE Only:

Notes:

Part II. Individual Discharge Information

The below information must be provided for each category or categories of discharge that will discharge to the sanitary sewer. See instructions for further guidance.

1. Discharge ID Number: **001 and 002**

2. Discharge Location: **001 is NE of CAA Airport Manager's Building (239 Maxim Rd). 002 is SW of CAA Aircraft Rescue and Fire Fighting Facility (229 Maxim Rd).**

3. Monitoring Location: **001 monitoring location will be sanitary manhole post oil-water separator (see Figure 1, attached) adjacent to 239 Maxim Road/Bldg #1.**

   002 monitoring location will be sanitary manhole post oil-water separator (see Figure 2, attached) adjacent to 229 Maxim Road/Bldg #3.

4. Miscellaneous Discharge Category(ies), Flow Info, Treatment and Duration (complete for all categories):

a. Group I (Process Wastewater) Discharges	b. Max Daily Flow (gpd)	c. Check box if treatment required	d. Is discharge continuous (hrs/day), intermittent (vol/batch) or transported (vol)
☐ Commercial laundry		☐	
☐ Contact cooling/heating		☐	
☐ Cutting/grinding		☐	
☐ Food processing		☐	
☐ Brewing/distilling (This is a subgroup of Food processing.)		☐	
☐ Non-destruct testing		☐	
☐ Printing/photo processing		☐	
☐ Reverse osmosis reject		☐	
☐ Tumbling/cleaning		☐	
☐ Water treatment		☐	
☐ Other (specify in 8, below):		☐	
e. Cumulative Max Daily Flow of Process WW Discharges			
f. Group II (Non-process Wastewater) Discharges			
☐ Air comp. condensate/blowdown		☐	
☐ Boiler blowdown		☐	
☐ Building maintenance		☐	
☐ Fire suppression system testing		☐	
7☐ Hydrostatic pressure testing		☐	
☐ Non-contact cooling		☐	
☐ Potable water system maint/sampling		☐	
☐ Swimming pool (public pool >5,000 gpd)		☐	
☒ Vehicle maintenance	**499**	☒	**Continuous 8hrs/day**
☐ Other (specify in 7, below):		☐	

g. Cumulative Max Daily Flow of Non-process WW Discharges	499		
h. Total Maximum Daily Flow (e. + g.)	499		

5. For intermittent (batch) or seasonal discharges from the table above, indicate the duration, frequency and time of day of the discharge (both maximum and average flows) and any other characteristics of the discharge that will help describe its flow pattern.

Not applicable, "continuous discharge".

6. Method of Flow Measurement: **Not applicable. §5(b)(2) "Group II non-process wastewaters are exempt from all monitoring requirements, unless otherwise directed by the POTW Authority, provided that the discharge is in compliance with the effluent limits of §5(a)(1) of this general permit." The 499-gallons per day discharge is an estimation.**

7. A detailed description of the processes or activities generating each of the discharge(s) from the table above. When different processes or activities produce different discharges, please be specific about each.

Wastewater generated by: 1) floor washdown and incidental drippage from airport vehicles as a result of routine vehicle servicing operations; and 2) washing of airport vehicle exteriors or steam cleaning of airport vehicle engines within Connecticut Airport Authority's Maintenance Garage Building and Maintenance and Aircraft Rescue and Fire Fighting Facility.

8. A description of any wastewater treatment processes, including, but not limited to, neutralization, oil/water separation, silver recovery and precipitation of solids or metals, etc. which the discharger utilizes or will utilize to achieve compliance with any of the local ordinances or effluent limits or conditions specified in Section 5(a) of the MIU general permit.

Sand Trap and Oil-Water Separator unit are installed prior to sanitary discharge at the Maintenance Garage Building (001). Oil-Water Separator unit is installed prior to sanitary discharge at the Maintenance and Aircraft Rescue Fire Fighting Facility (002).

9. A list of the substances used or added to the wastewater shall be provided, including but not limited to those substances for which effluent limits are specified in Section 5(a) of the MIU general permit and those substances listed in Appendix B Table II, III and V or Appendix D of section 22a-430-4 of the Regulations of Connecticut State Agencies (attached as Appendix F to the MIU GP). Any such substances shall be identified by their generic chemical names and Chemical Abstract System (CAS) number. Safety Data Sheets must be provided for any such substances as requested by the POTW Authority.

None.

WINDSOR LOCKS, CT 06096

12/13/2013

Dear Permittee:

Enclosed is a certificate of registration for the general permit recently issued to you by our office.

This certificate will serve two purposes. First, this is a way for us to acknowledge to you that your registration has been processed. Second, it is a way for our inspection staff to know that you have the appropriate permit for your discharges.

The expiration date noted is the expiration date for all discharges registered for this permit. A mass mailing will be done nine months prior to the expiration of this permit to notify you of this date together with instructions on how to file for a permit renewal.

When corresponding with our office regarding your registration please use the "Site No." and the "Permit No." on the certificate. These numbers are unique to your discharge and its location.

If you have any questions regarding general permits for wastewater discharges please feel free to call 860-424-3018 and ask for the Engineer of the Day.

Enclosure

Subject: [EXTERNAL] MDC Approval - MIU GP Notification - CAA - Hartford-Brainard Airport - GVM001667

CAUTION: This email originated from outside the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Good Afternoon Bill,

You are all set. Thank you for completing the MIU General Permit Notification forms for the vehicle maintenance wastewater for the Hartford-Brainard Airport located at 233 Maxim Road in Hartford which meets the notification requirements for MDC and is approved for discharging to the MDC sanitary sewer.

Also the facility should be aware of the requirements is the MIU especially the best management practices in Appendices G & H (12).

Please email if any changes are made to the discharge in the future.

Let me know if you have any questions.

Thanks,
Craig

Subject: MIU GP Notification - CAA - Hartford-Brainard Airport - GVM001667

Mr. Scott,

Attached you will find the completed notification submittal package pertaining to the CT DEEP General Permit for Discharges from Miscellaneous Industrial Users (MIU GP) for Connecticut Airport Authority's vehicle maintenance wastewater discharges from our facilities located at the Hartford-Brainard Airport, 233 Maxim Road, Hartford, CT.

This wastewater discharge was previously authorized under the now expired and retired CT DEEP General Permit for the Discharge of Vehicle Maintenance Wastewater (GP-010) under permit no. GVM001667.

Should you have any questions, please do not hesitate to contact me at (860) 254-5882 or bborowiec@ctairports.org.

Thank you,
Bill

VI. XRF DATA SHEETS

I. INTRODUCTION

Introduction

Lead poisoning is a significant health hazard. High lead concentrations in the body can cause serious damage to the kidneys, the red blood cells, the central nervous system and the brain. One source of lead in the environment is lead-based paint. Leaded paint may contain up to 50% lead. Lead-based paint was widely used until it was banned in 1978.

Inspection Report

This inspection report consists of an introduction, project narrative, sample results table, sample results diagram and inspection data pages. Two reference pages are also included in the report. The cover page includes the project name and address.

The project narrative is an explanation of what was found during the inspection. This includes where the samples were taken, and the results of each test. The type of substrate under the paint and the condition of the paint are explained in this summary.

The data pages include the results of each test. This includes the sample numbers, the type of test used and the results of each test. These results are given in milligrams per square centimeter (mg/cm^2). The data pages also include the condition of the paint, and the substrate surface type. The paint condition and surface types are explained in reference tables A and B.

A Niton XL-309 XRF Spectrum Analyzer was used during the inspection. This instrument measures a paint sample until a 95% confident reading of "positive" or "negative" versus the toxic level of lead which is 1.0 mg/cm2 as deemed by the State of Connecticut.

The XRF is calibrated at the beginning and the end of the day's inspections or at extended delays in testing and (at least) every four hours during inspections. If at any time the instrument does not calibrate according to the standardized sample and the instrument limit of detection the instrument is taken out of service.

II. PROJECT NARRATIVE

II. PROJECT NARRATIVE

Overview

On October 10, 2001 EnviroMed Services, Inc. performed a lead inspection using a direct read spectrum analyzer for the State of Connecticut Department of Transportation, at Building # 85-003 Brainard Airport Garage, located in Hartford, Connecticut. The purpose of this inspection was to identify the presence of lead on the components prior to renovation/demolition.

The OSHA Lead in Construction Standard 29 CFR 1926.62 deems paint to be lead containing when any detectable lead is found. The State of Connecticut Lead Regulations deem paint to be a "toxic level" when X-Ray Fluorescence Analysis (XRF) exceeds 1.0 milligrams per centimeter squared (mg/cm^2), or 0.5% by weight in dry form. (l9A-111-3). The State of Connecticut Department of Environmental Protection (DEP) regulations require building materials found to contain toxic levels of lead, to be Toxicity Characteristic Leaching Procedure (TCLP) tested for waste determination prior to disposal.

Summary of Results

XRF analysis was performed utilizing the Niton - XL 309 Spectrum Analyzer. Lead containing paint was found on building components. Please refer to the XRF Data Sheets for a list of all XRF results and the Sample Location Diagram for all sample locations. Toxic levels of lead were found on building components. Please refer to the XRF Toxic Level Sample Results Table for a list of toxic level XRF readings (greater than or equal to 1.0 mg/cm^2).

III. SAMPLE RESULTS TABLE

Facility: Hartford-Brainard Airport, Connecticut Airport Authority

FACILITY NAME AND LOCATION:
Hartford-Brainard Airport, Connecticut Airport Authority
Dept:
233 Maxim Road
Hartford, Connecticut 06114-1607 USA
Emergency 24-Hour Phone Number: 860-982-2443
County: Capitol Planning Region
Fire District:
Latitude: 41.744596
Longitude: -72.652097
MAILING ADDRESS: 239 Maxim Road
Hartford, Connecticut 06114-1607 USA

☐ All facility information (not including chemical information) is identical to last year's submission

IDENTIFICATION NUMBERS:
Dun & Bradstreet: N/A
NAICS: 481219 (Other Nonscheduled Air Transportation)
SIC: 4581 (AIRPORTS, FLYING FIELDS & SER)
State ID: 64-8620 (CTDEEP Underground Storage Tank Site ID)

Is the facility manned? ☑ Manned ☐ Unmanned
Maximum No. of Occupants: 150

REGULATORY INFORMATION:
Subject to Emergency Planning under Section 302 of EPCRA (40 CFR part 355)? ☐ Yes ☑ No
Subject to Chem. Accident Prevention under Section 112(r) of CAA (40 CFR part 68, Risk Mgmt. Pgm.)? ☐ Yes ☑ No

CHEMICAL INVENTORY INFORMATION:

Mixture or Product Name: BATTERIES, WET, FILLED WITH ACID
CAS #: 7664-93-9
Chemical Category: ☐ Pure ☑ Mixture
EHS: ☑ Yes ☐ No
Physical State: ☑ Solid ☑ Liquid ☐ Gas
☐ Identical to previous year
☐ Trade secret

PHYSICAL HAZARDS:
- ☑ Explosive
- ☐ Flammable (gases, aerosols, liquids, or solids)
- ☐ Oxidizer (liquid, solid, or gas)
- ☐ Self-reactive
- ☐ Pyrophoric (liquid or solid)
- ☐ Pyrophoric gas
- ☐ Self-heating
- ☐ Organic peroxide
- ☐ Corrosive to metal
- ☐ Gas under pressure (compressed gas)
- ☐ In contact with water emits flammable gas
- ☐ Combustible dust

HEALTH HAZARDS:
- ☑ Acute toxicity (any route of exposure)
- ☑ Skin corrosion or irritation
- ☑ Serious eye damage or eye irritation
- ☐ Respiratory or skin sensitization
- ☐ Germ cell mutagenicity
- ☑ Carcinogenicity
- ☑ Reproductive toxicity
- ☑ Specific target organ toxicity (single or repeated exposure)
- ☐ Aspiration hazard
- ☐ Simple asphyxiant

☐ Hazard not otherwise classified

AMOUNTS:
☑ Below Reporting Thresholds
Maximum Amount: 1,485 pounds Maximum Amount code: 04 (1,000-4,999 pounds)
Average Daily Amount: 1,485 pounds Average Daily Amount code: 04 (1,000-4,999 pounds)
Max amount in largest container: 70 pounds

Facility: Hartford-Brainard Airport, Connecticut Airport Authority (continued)

Days on site: 365

STORAGE LOCATIONS:
☐ Confidential

Location Description: Hartford-Brainard Airport maintenance buildings
Container Type: Battery Pressure: Ambient pressure Temperature: Ambient temperature
Amount: 1,485 pounds

MIXTURE COMPONENTS:

Name: LEAD CAS #: 7439-92-1 ☐ EHS
Max Amt Code: 03 (500-999 pounds) Component Percentage: 55 (by weight)

Name: SULFURIC ACID CAS #: 7664-93-9 ☑ EHS
Max Amt Code: 02 (100-499 pounds) Component Percentage: 20 (by weight)

Site Reconnaissance

General Description: The Brainard Field Armory is located in a heavily developed commercial area of the Brainard Airport of Hartford, Connecticut. The area is supplied with both city water and sewer service. The Connecticut River is located approximately 700 feet east of the site. The topography of the airport is flat with a dike separating the airport from the Connecticut River to the east. The building is located to the west of the tank grave.
